QUESTION 1

Scenario: An administrator needs to install Windows Server 2008 R2 on a new virtual machine. The Windows Server 2008 R2 ISO file is located on a Windows share.

Which storage repository does the administrator need to create to be able to mount the ISO file to the new virtual machine?

A. iSCSI

B. CIFS

C. NFS ISO

D. StorageLink

Correct Answer: B

QUESTION 2

An administrator is setting up the XenServer hosts in an environment to boot from SAN. In which BIOS would the administrator go to enable XenServer to boot from SAN?

A. Host

B. Array controller

C. Network interface card

D. Primary host bus adapter

Correct Answer: D

QUESTION 3

An administrator needs to throttle traffic from the virtual print server because it has been impacting all virtual machines on the network.

On which object should the QoS policy be configured?

A. VM

B. Global

C. Server

D. Network

Correct Answer: A

QUESTION 4

Scenario: An administrator is troubleshooting a Provisioning services environment. After the administrator configured a new version of the vDisk for 10 identical target devices all running on the same XenServer host, the administrator discovers that only the first target device started with the new vDisk configured. The other nine target devices failed to startup.

What is one of the steps the administrator should take to resolve this issue?

A. Configure the PXE Service.

B. Configure the bootstrap file.

C. Restart the Stream Service.

D. Change the vDisk access mode.

Correct Answer: D

QUESTION 5

Scenario: An administrator needs to change the pool master to prepare for maintenance activities during the evening. High availability is currently enabled.

Using the XenCenter Console, what must the administrator do to change the pool master?

A. Disable high availability.

B. Configure workload balancing.

C. Enable virtual machine protection policy.

D. Enter maintenance mode on the pool master.

Correct Answer: D
