QUESTION 1

Which two features are provided by decision tables?

A. Sets of input data can be bucketed and reviewed for gaps.

B. Data sets can be reviewed for conflicts.

C. Data can be used for only one rule evaluation.

D. A rule evaluation can be used only to enter new output data.

Correct Answer: AB

After you create a Decision Table there are operations that you may want to perform on the Decision Table, including the following:

(A)

 Find and fix gaps in a Decision Table

(B)

 Finding and resolving conflicts between rules in a Decision Table Compact or split cells in a Decision Table Merge a condition or split a condition in a Decision Table

A: * Compact the Decision Table

In this step you compact the rules to merge from eighteen rules to nine rules. This automatically eliminates the rules that are not needed and preserves the no gap, no conflict properties for the Decision Table.

* The Conditions area in a Decision Table includes one or more condition rows. Each condition row has a condition expression and, for each rule, a condition cell. A condition expression is an expression that you build in Rules Designer. The condition expression is often a fact property or a function result, but it can be any expression that has a type that can be associated with a bucketset.

B: A Decision Table displays multiple related rules in a single spreadsheet-style view. In Rules Designer a Decision Table presents a collection of related business rules with condition rows, rules, and actions presented in a tabular form that is easy to understand. Business users can compare cells and their values at a glance and can use Decision Table rule analysis features by clicking icons and selecting values in Rules Designer to help identify and correct conflicting or missing cases.

QUESTION 2

In a BPEL model, what is quickest way to implement a capability to skip rule execution if particular condition holds?

A. Model a switch activity to conditionally execute the business rule component.

B. Use a skip condition on the business rule component.

C. Include an XPath expression in an annotation on the business rule component.

D. Use a correlation set on the business rule component.

Correct Answer: C

QUESTION 3

Each JCA adapter has a single deployment listed in the WLS Console. Identify two accurate descriptions about managing multiple instances of each adapter in the runtime.

A. Instance configuration in the SOA Suite deployment plan

B. JCA tiles for each adapter instance

C. Adapter connection factories specified in the WLS Console

D. One entry per adapter instance in the adapters_config.xml file

Correct Answer: AD

* The Oracle Database Adapter is a JCA 1.5 connector, which is deployed to the application server during installation.

The Oracle Database Adapter consists of multiple instances; each instance represents a connection to a database end point. Different SOA processes may point to the same adapter instance (database), while different service endpoints in a

SOA process may point to different adapter instances (databases). Because each adapter instance points to a single database, there is a one-to-one correspondence from adapter instances to application server data sources. Out of the box

there is a single Oracle Database Adapter instance named eis/DB/SOADemo, which points to the data source jdbc/SOADataSource.

The list of adapter instances is stored in a deployment descriptor file, weblogic-ra.xml on Oracle WebLogic Server. (It is inside of DbAdapter.rar, which contains also the Java class files in DBAdapter.jar). Configuring an Oracle Database

Adapter instance is more about creating the underlying data source:

getting the correct JDBC driver and connection URL.

QUESTION 4

You are modeling a conditional branch using a Switch element. You choose not to include an Otherwise branch. What is the result?

A. A business fault is generated if one of the case branches cannot execute.

B. A design time error is indicated by JDeveloper.

C. You need to include fault handler to account for the fact that none of the case branches can execute.

D. If none of the case branches can execute, control passes to (the next element in the BPEL model.

Correct Answer: D

Note:

* Conditional branching introduces decision points to control the flow of execution of a BPEL process. You can use a switch activity to produce different actions based on conditional branching. You set up two or more branches, with each branch in the form of an XPath expression. If the expression is true, then the branch is executed. If the expression is false, then the BPEL process moves to the next branch condition, until it either finds a valid branch condition, encounters an otherwise branch, or runs out of branches. If more than one branch condition is true, then BPEL executes the first true branch.

QUESTION 5

Which SOA Suite capability enforces WS-* standards for authentication and authorization?

A. BPEL Process Manager

B. Enterprise Manager

C. B2B

D. Web Services Manager

Correct Answer: D

Note: You can use Oracle Web Services Manager (WSM) WS-Security policies with WebLogic Server.
