-  **365 Days** Free Update
-  **800,000+** Satisfied Customers

QUESTION 1

When you are troubleshooting an ACL issue on a router, which command would you use to verify which interfaces are affected by the ACL?

- A. show ip access-lists
- B. show access-lists
- C. show interface
- D. show ip interface
- E. list ip interface

Correct Answer: D

Incorrect answer:

show ip access-lists does not show interfaces affected by an ACL.

QUESTION 2

What are three features of the IPv6 protocol? (Choose three.)

- A. optional IPsec
- B. autoconfiguration
- C. no broadcasts
- D. complicated header
- E. plug-and-play
- F. checksums

Correct Answer: BCE

An important feature of IPv6 is that it allows plug and play option to the network devices by allowing them to configure themselves independently. It is possible to plug a node into an IPv6 network without requiring any human intervention. This feature was critical to allow network connectivity to an increasing number of mobile devices. This is accomplished by autoconfiguration. IPv6 does not implement traditional IP broadcast, i.e. the transmission of a packet to all hosts on the attached link using a special broadcast address, and therefore does not define broadcast addresses. In IPv6, the same result can be achieved by sending a packet to the link-local all nodes multicast group at address ff02::1, which is analogous to IPv4 multicast to address 224.0.0.1.

QUESTION 3

Which NAT function can map multiple inside addresses to a single outside address?

- A. PAT
- B. SFTP
- C. RARP
- D. ARP
- E. TFTP

Correct Answer: A

QUESTION 4

Refer to the exhibit.

A new subnet with 60 hosts has been added to the network. Which subnet address should this network use to provide enough usable addresses while wasting the fewest addresses?

- A. 192.168.1.56/26
- B. 192.168.1.56/27
- C. 192.168.1.64/26
- D. 192.168.1.64/27

Correct Answer: C

A subnet with 60 host is $2^6 - 2 = 64 - 2 = 62$ 6 bits needed for hosts part. Therefore subnet bits are 2 bits (8-6) in fourth octet. $8\text{bits} + 8\text{bits} + 8\text{bits} + 2\text{bits} = /26$ /26 bits subnet is 24bits + 11000000 = 24bits + 192 256 ?192 = 64 0 -63 64 ?127

QUESTION 5

Which three are valid modes for a switch port used as a VLAN trunk? (Choose three.)

- A. transparent
- B. auto
- C. on

D. desirable

E. blocking

F. forwarding

Correct Answer: BCD

These are the different types of trunk modes:

ON: This mode puts the port into permanent trunk mode and negotiates to convert the link into a trunk link. The port becomes a trunk port even if the adjacent port does not agree to the change.

OFF: This mode puts the port into permanent non-trunk mode and negotiates to convert the link into a non-trunk link. The port becomes a non-trunk port even if the adjacent port does not agree to the change.

Desirable: This mode causes the port to actively attempt to convert the link into a trunk link. The port becomes a trunk port if the adjacent port is set to on, desirable, or auto mode.

Auto: This mode enables the port to convert the link into a trunk link. The port becomes a trunk port if the adjacent port is set to on or desirable mode. This is the default mode for Fast and Gigabit Ethernet ports.

Nonegotiate: This mode puts the port into permanent trunk mode, but does not allow the port to generate Dynamic Trunking Protocol (DTP) frames. The adjacent port must be configured manually as a trunk port to establish a trunk link.
