**QUESTION 2**

Which statement about configuration of Layer 2 wireless user authentication on a Cisco WLC is true?

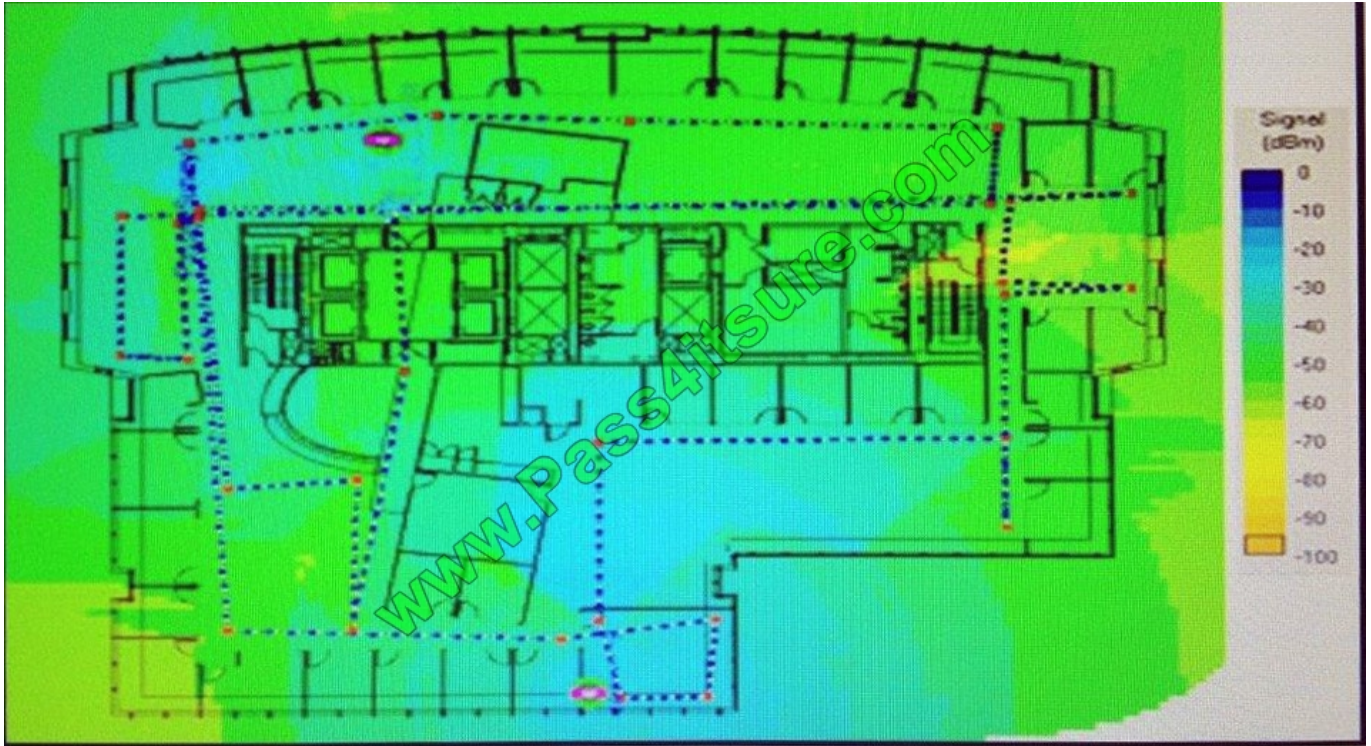

- A. Local EAP is used only if an external RADIUS is not configured or is unreachable.
- B. The external RADIUS is used only if local EAP is not configured.
- C. The administrator chooses whether local EAP or an external RADIUS is used first.
- D. The external RADIUS is used only if local EAP is explicitly disabled.

Correct Answer: A

If any RADIUS servers are configured on the controller, the controller tries to authenticate the wireless clients using the RADIUS servers first. Local EAP is attempted only if no RADIUS servers are found, either because the RADIUS servers timed out or no RADIUS servers were configured. If four RADIUS servers are configured, the controller attempts to authenticate the client with the first RADIUS server, then the second RADIUS server, and then local EAP. If the client attempts to then reauthenticate manually, the controller tries the third RADIUS server, then the fourth RADIUS server, and then local EAP. Correct Answer: BDE

### QUESTION 5

Microsoft Active Directory integrated machines are not authenticating to the internal WLAN. The WLAN settings are WPA2-AES-802.1x and are authenticating to a Cisco Identity Services Engine server. You investigate and note that non-domain authenticated machines are properly authenticating to the WLAN using their Active Directory credentials. Why would this problem occur?

- A. The WLAN is configured improperly in group policy.
- B. The ISE server is not joined to the domain, causing authentications to fail.
- C. The domain machines are configured to disable the wireless adapter.
- D. The non-domain machines are using local accounts that are not authenticated through the domain.
