QUESTION 1

Highlighting the top 10 listed IP addresses in an IP table and then clicking the "Multi-Group Metric Time Series Chart" icon in the toolbar delivers what result?

- A. It graphs the throughput of the first listed IP.
- B. It sums the throughput for the highlighted IP addresses and then graphs the result.
- C. It graphs the throughput for each of the highlighted IP addresses overlaid on the same graph.
- D. It does nothing, as more configuration is needed.

Correct Answer: C

QUESTION 2

AppResponse Xpert can be configured to mask out all sensitive information contained in key value pairs that might appear in observed web traffic. Where is this configured?

- A. In the Java console, under Tools > Pages > Information Privacy Manager
- B. In the Java console, under Tools > Pages > User Session Tracking Manager
- C. In the web user interface under System > Pages > Information Privacy Manager
- D. In the web user interface under System > Setup > Information Privacy Manager

Correct Answer: A

QUESTION 3

The PathProbe utility in AppTransaction Xpert helps:

- A. Estimate connectivity to capture agents
- B. Estimate hop-by-hop Layer 2 path
- C. Estimate server delay
- D. Estimate bandwidth and latency

Correct Answer: D

QUESTION 4

What is the difference between the originating IP and the client IP of an individual page view?

- A. There is no difference.

B. The originating IP is the closest layer-3 hop in the network path, while the client IP is the user's IP address.

C. The client IP is the user's IP address, and the originating IP is the IP address of a proxy or load balancer in the application path.

D. The originating IP sends the initial page request, and the client IP may be a proxy that receives and forwards the request to the server.

E. The originating IP is the user's IP address, and the client IP is the address of the server which receives and responds to that user's request.

Correct Answer: D

QUESTION 5

The AppReponse Xpert Database Statement Troubleshooting Insight is useful to: (Select 3)

A. Troubleshoot a specific SQL statement by viewing data for all transactions that use the SQL statement of interest.

B. Analyze the query execution plan.

C. Define the total response time or transaction count by database, user, application, and so on.

D. View metrics for the slowest SQL queries.

E. Automatically generate alternative SQL queries.

Correct Answer: ACD
