QUESTION 1

Scenario 3:

After resolving numerous connectivity Issues throughout the various branch sites, connectivity between applications and users is finally present. The network administrator is informed that during certain tests, applications are not performing as they are expected to. Users report that call quality has not fully improved and that some of their calls either drop or have poor voice quality where the conversation is breaking up. Other users are noticing that file transfers are slower than expect. A group of users from a few sites have reported slowness in accessing internal and external applications.

Exhibit.

Users at a remote office are complaining about poor performance with certain applications. The network administrator has already verified the configuration is correct.

Which two parameters should the administrator review to troubleshoot this issue? (Choose two.)

- A. Check the underlay network (bandwidth, latency, jitter, packet loss)
- B. Change the bandwidth measurement under WAN Overlay Advanced Settings
- C. Check the flows to verify which Business Policy the traffic of interest is matching
- D. Look under Monitor, check Business priority tab

Correct Answer: AD

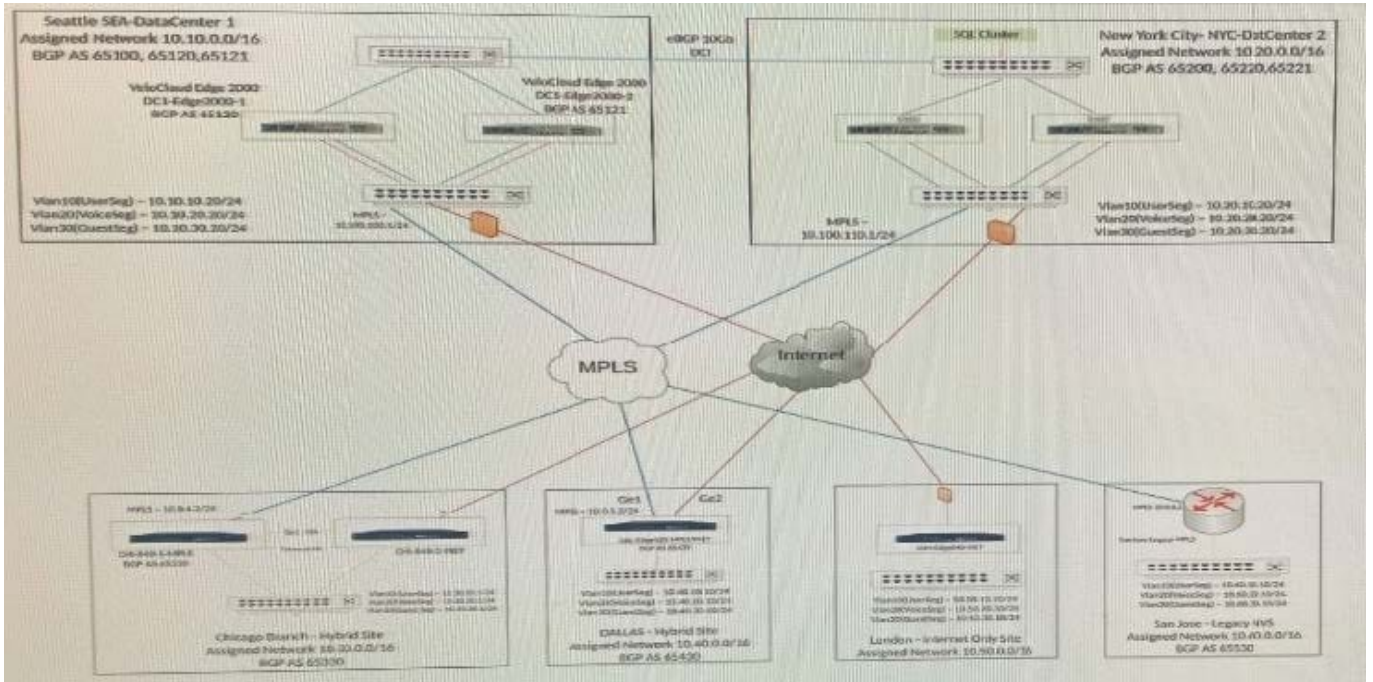

QUESTION 2

Scenario 2:

After completing the branch activation activities for all required branches, the network administrator attempts to test connectivity between the various branches and between the hubs and branches. The administrator notices a lack of connectivity despite being certain that configurations have been complete. The administrator also observed that several users are reporting intermittent connectivity to some of the applications they are accessing. Other users are reporting no access to these applications. Other users at some of the branches claim they cannot get to certain public resources. The administrator wants to ensure that all sites can talk to each other and all resources are accessible.

Exhibit.

A network administrator decides to deploy a local Checkpoint VNF appliance on the Edge in London to cut back on unnecessary traffic towards the NY Hub location. While attempting to deploy the VNF, the process keeps failing.

Where can the administrator check to see more detail?

- A. VCO > Monitor > Logging
- B. VCO > Monitor > Events
- C. VCO > Test and Troubleshoot > Remote Diagnostics > Events
- D. VCO > Test and Troubleshoot > Remote Actions > Alerts

Correct Answer: B

QUESTION 3

Scenario 1:

The Dallas Branch location is having issues getting activated. The local network administrator is aware that the Edge device received a DHCP address and was able to connect to the internet. The Orchestrator is reporting the Edge as Down. No other changes were made post activation.

A network administrator is tasked with enabling SD-WAN at three branch locations. A topology has been provided for reference. For each site, the administrator is having issues bringing edges

online, as another administrator has gone ahead and created a configuration ahead of time. The organization has several branch sites. One is an Internet-only site and two are Hybrid locations with both internet and MPLS. The last location is MPLS only. There are hub data center locations in this environment as well. Please refer to the topology.

Refer to the Exhibit(s).

Interface Settings							
Actions		Interface	Mode	VLANs	Addressing	WAN Overlay	Segment
✎	✕	LAN1	Access	1 - Corporate			Global Segment
✎	✕	LAN2	Access	1 - Corporate			Global Segment
✎	✕	LAN3	Access	1 - Corporate			Global Segment
✎	✕	LAN4	Access	1 - Corporate			Global Segment
✎	☑	LAN5	Trunk	1 - Corporate 10 - UserSeg 20 - VoiceSeg 30 - GuestSeg			Global Segment Global Segment Global Segment Global Segment
✎	✕	LAN6	Access	1 - Corporate			Global Segment
✎	✕	LAN7	Access	1 - Corporate			Global Segment
✎	✕	LAN8	Access	1 - Corporate			Global Segment
✎	☑	GE1	Access	1 - Corporate	Static IP: 10.0.0.200 Gateway: 192.0.5.1	↓ User Defined	all segments
✎	☑	GE2	Access	1 - Corporate	DHCP	↓ User Defined	all segments
✎	✕	SFP1	Access	1 - Corporate	DHCP	≡ Auto Detect	all segments
✎	✕	SFP2	Access	1 - Corporate	DHCP	≡ Auto Detect	all segments
✎	☑	WLAN1	WiFi	1 - Corporate			Global Segment
✎	✕	WLAN2	WiFi	Interface disabled			

WAN Settings						
Type	Name	Interfaces	Link Type	Public IP	Alerts	
↓ User Defined	INET	GE1	Public Wired			✕
↓ User Defined	MPLS	GE2	Private Wired			✕

What is the cause of this issue?

- A. The activation link did not specify the updated image location requiring the Edge to be re-activated.
- B. The activation link did not contain any post-activation configuration to allow the Orchestrator to communicate with the Edge.
- C. The Edge will be offline for about 4 hours until it has completed the factory image installation.
- D. The activation link contained incorrect configurations for WAN overlays and WAN interfaces.

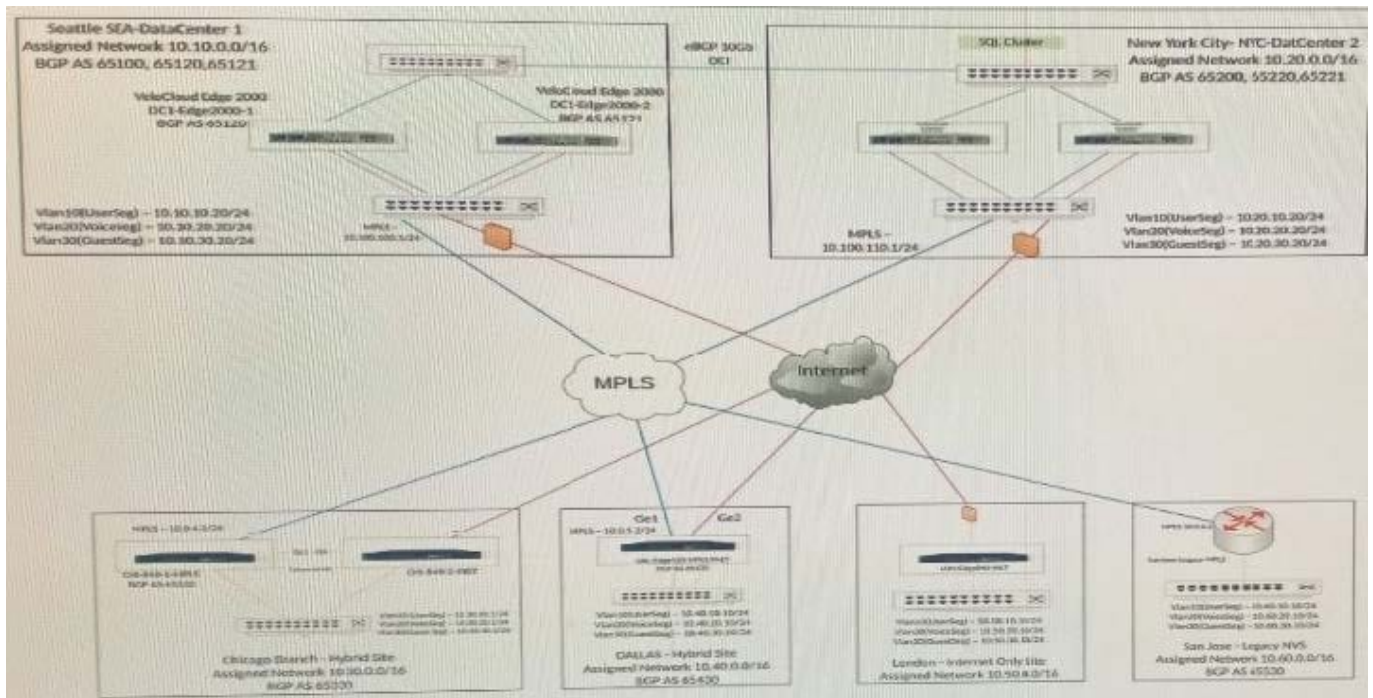

Correct Answer: A

QUESTION 4

Scenario 2:

After resolving numerous connectivity Issues throughout the various branch sites, connectivity between applications and users is finally present. The network administrator is informed that during certain tests, applications are not performing as they are expected to. Users report that call quality has not fully improved and that some of their calls either drop or have poor voice quality where the conversation is breaking up. Other users are noticing that file transfers are slower than expect. A group of users from a few sites have reported slowness in accessing internal and external applications.

Exhibit.

A network administrator has configured a Business Policy to send a specific application directly out an underlay interface. Users have complained of slow responses for that application. While troubleshooting, the network administrator finds the traffic is actually taking an overlay path to another SD-WAN Edge.

What is causing this behavior?

- A. The other Edge location is advertising a secure route for the application's subnet.
- B. ul has been configured forcing traffic into the underlay towards the hub.
- C. Configuring Business Policy Direct settings have no affect on traffic flows.
- D. Internet Backha.
- E. The underlay path is not available forcing traffic into the overlay.

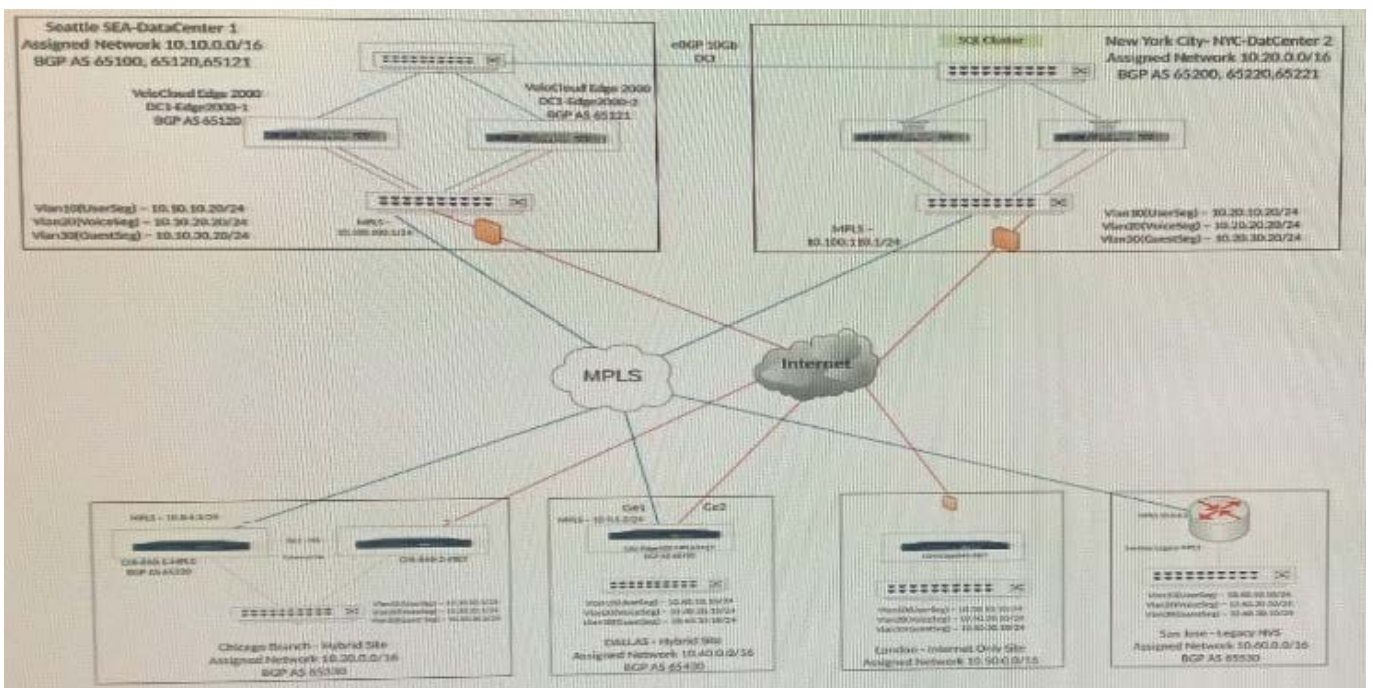

Correct Answer: E

QUESTION 5

Scenario 3:

After resolving numerous connectivity Issues throughout the various branch sites, connectivity between applications and users is finally present. The network administrator is informed that during certain tests, applications are not performing as they are expected to. Users report that call quality has not fully improved and that some of their calls either drop or have poor voice quality where the conversation is breaking up. Other users are noticing that file transfers are slower than expect. A group of users from a few sites have reported slowness in accessing internal and external applications.

Exhibit.

The network administrator has been made aware that Chicago is receiving traffic from non- SD-WAN sites, bottlenecking Chicago's interfaces. The network administrator's VMware SE has mentioned using the uplink feature to help resolve this.

What are two ways the uplink feature should be used in this scenario? (Choose two.)

- A. Set the uplink community to forward traffic to a group of neighbors.
- B. Direct all traffic to that neighbor designated as an uplink,
- C. Stop mutual redistribution of routes from underlay and overlay.
- D. Prevent the site in question from becoming a transit site.

Correct Answer: BD
