QUESTION 1

Your network contains an Active Directory domain named contoso.com. The domain contains two domain controllers named DC1 and DC2.

You discover that client computers authenticate to both domain controllers.

You need to ensure that client computers only authenticate to DC2 if DC1 fails. The solution must be persistent.

What should you do?

- A. From DNS Manager, modify the weight value of the service location (SRV) records.
- B. From Registry Editor, create the LdapSrvweigh value.
- C. From DNS Manager, modify the priority value of the service location (SRV) records.
- D. From Registry Editor, create the LdapSrvpriority value.

Correct Answer: B

Explanation: QUESTION NO: 287

Your network contains an Active Directory domain.

A Group Policy object (GPO) named GPO1 is linked to the domain. GPO1 has the settings shown in the following table.

Policy	Policy setting
Enforce password history	5 passwords remembered
Minimum password length	10 characters

You have a backup of a GPO named GPO2. GPO2 has the settings shown in the following table.

Policy	Policy setting
Minimum password length	5 characters
Store passwords using reversible encryption	Enabled

You import the backup into GPO1.

You need to identify the configuration in GPO1.

What should you identify?

A.

*

Enforce password history is not set to Not Defined.

*

Minimum password length is set to 5 characters.

*

Store passwords using reversible encryption is set to Enabled.

B.

*

Enforce password history is set Not Defined.

*

Minimum Password length is set to 10 characters.

*

Store passwords using reversible encryption is set to Enabled.

C.

*

Minimum password length is set to 10 characters.

*

Enforce password history is set to 5 password remembered.

*

Store password using reversible encryption is set to Enabled.

D.

*

Minimum password length is set to 5 characters.

*

Enforce password history is set to 5 password remembered.

*

Stop passwords using reversible encryption is set to Enabled. Answer: A

QUESTION 2

Your network contains an Active Directory domain named contoso.com. The domain contains three member servers named Server1, Server2, and Server3. All servers run Windows Server 2012 R2 and have the Windows Server Update

Services (WSUS) server role installed.

Server1 and Server2 are configured as replica servers that use Server3 as an upstream server.

You remove Servers from the network.

You need to ensure that WSUS on Server2 retrieves updates from Server1. The solution must ensure that Server1 and Server2 have the latest updates from Microsoft.

Which command should you run on each server? To answer, select the appropriate command to run on each server in the answer area.

Hot Area:

Server1	<ul style="list-style-type: none">set-wsuserversynchronization -syncfrommuset-wsuserversynchronization -useservername server1set-wsuserversynchronization -useservername server2wsusutil.exe movecontent \\server1\c\$wsusutil.exe movecontent \\server2\c\$
Server2	<ul style="list-style-type: none">set-wsuserversynchronization -syncfrommuset-wsuserversynchronization -useservername server1set-wsuserversynchronization -useservername server2wsusutil.exe movecontent \\server1\c\$wsusutil.exe movecontent \\server2\c\$

Correct Answer:

Server1	<ul style="list-style-type: none">set-wsuserversynchronization -syncfrommuset-wsuserversynchronization -useservername server1set-wsuserversynchronization -useservername server2wsusutil.exe movecontent \\server1\c\$wsusutil.exe movecontent \\server2\c\$
Server2	<ul style="list-style-type: none">set-wsuserversynchronization -syncfrommuset-wsuserversynchronization -useservername server1set-wsuserversynchronization -useservername server2wsusutil.exe movecontent \\server1\c\$wsusutil.exe movecontent \\server2\c\$

QUESTION 3

Your network contains an Active Directory domain named adatum.com. The domain contains 10 domain controllers that run Windows Server 2012 R2.

You plan to create a new Active Directory-integrated zone named contoso.com.

You need to ensure that the new zone will be replicated to only four of the domain controllers.

What should you do first?

- A. Create an application directory partition.
- B. Create an Active Directory connection object.
- C. Create an Active Directory site link.
- D. Change the zone replication scope.

Correct Answer: A

Application directory partitions An application directory partition is a directory partition that is replicated only to specific domain controllers. A domain controller that participates in the replication of a particular application directory partition hosts a replica of that partition. Only domain controllers running Windows Server 2003 can host a replica of an application directory partition.

QUESTION 4

Your network contains an Active Directory forest named contoso.com. The functional level of the forest is Windows Server 2008 R2.

All of the user accounts in the marketing department are members of a group named Contoso\MarketingUsers. All of the computer accounts in the marketing department are members of a group named Contoso\MarketingComputers.

A domain user named User1 is a member of the Contoso\MarketingUsers group. A computer named Computer1 is a member of the Contoso\MarketingComputers group.

You have five Password Settings objects (PSOs). The PSOs are defined as shown in the following table.

Password setting	Directly applies to	Precedence	Minimum password length
PSO1	Contoso\Domain Users	16	14
PSO2	Contoso\MarketingUsers	20	11
PSO3	Contoso\MarketingComputers	10	12
PSO5	User1	1	10

When User1 logs on to Computer1 and attempts to change her password, she receives an error message indicating that her password is too short.

You need to tell User1 what her minimum password length is.

What should you tell User1?

- A. 10
- B. 11

C. 12

D. 14

Correct Answer: A

One PSO has a precedence value of 2 and the other PSO has a precedence value of 4. In this case, the PSO that has the precedence value of 2 has a higher rank and, hence, is applied to the object.

QUESTION 5

Your company has a main office and a branch office.

The network contains an Active Directory domain named contoso.com.

The main office contains a domain controller named DC1 that runs Windows Server 2012 R2. DC1 is a DNS server and hosts a primary zone for contoso.com. The branch office contains a member server named Server1 that runs Windows

Server 2012 R2. Server1 is a DNS server and hosts a secondary zone for contoso.com.

The main office connects to the branch office by using an unreliable WAN link.

You need to ensure that Server1 can resolve names in contoso.com if the WAN link is unavailable for three days.

Which setting should you modify in the start of authority (SOA) record?

A. Retry interval

B. Refresh interval

C. Expires after

D. Minimum (default) TTL

Correct Answer: C

Used by other DNS servers that are configured to load and host the zone to determine when zone data expires if it is not renewed
