**QUESTION 1**

Your network contains an Active Directory domain named contoso.com. The domain contains a file server named Server1 that runs Windows Server 2012 R2. All client computers run Windows 8. You need to configure a custom Access Denied message that will be displayed to users when they are denied access to folders or files on Server1.

What should you configure?

- A. A classification property
- B. The File Server Resource Manager Options
- C. A file management task
- D. A file screen template

Correct Answer: B

Access-denied assistance can be configured by using the File Server Resource Manager console on the file server.

Note: Access-denied assistance is a new feature in Windows Server 2012, which provides the following ways to troubleshoot issues that are related to access to files and folders:

Self-assistance. If a user can determine the issue and remediate the problem so that they can get the requested access, the impact to the business is low, and no special exceptions are needed in the central access policy. Access-denied

assistance provides an access-denied message that file server administrators can customize with information specific to their organizations. For example, an administrator could set the message so that users can request access from a data

owner without involving the file server administrator.

Reference: Scenario: Access-Denied Assistance

QUESTION 2

You have a server named Server1 that runs Windows Server 2012 R2.

A Microsoft Azure Backup of Server1 is created automatically every day.

You need to view the items that are included in the backup.

Which cmdlet should you run?

- A. Get-WBSummary
- B. Get-WBFileSpec
- C. Get-WBJob
- D. Get-OBFileSpec

Correct Answer: D

QUESTION 3

Your network contains an Active Directory domain named contoso.com. The domain contains two member servers named Server1 and Server2. All servers run Windows Server 2012 R2.

Server1 and Server2 have the Failover Clustering feature installed. The servers are configured as nodes in a failover cluster named Cluster1.

You add two additional nodes to Cluster1. You need to ensure that Cluster1 stops running if three nodes fail.

What should you configure?

- A. Affinity-None
- B. Affinity-Single
- C. The cluster quorum settings
- D. The failover settings
- E. A file server for general use
- F. The Handling priority
- G. The host priority
- H. Live migration
- I. The possible owner
- J. The preferred owner
- K. Quick migration
- L. the Scale-Out File Server

Correct Answer: C

The quorum configuration in a failover cluster determines the number of failures that the cluster can sustain.

Reference: Understanding Quorum Configurations in a Failover Cluster <http://technet.microsoft.com/en-us/library/cc731739.aspx>

QUESTION 4

Your network contains an Active Directory forest. The forest contains two domains named contoso.com and fabrikam.com. The functional level of the forest is Windows Server 2003.

You have a domain outside the forest named adatum.com.

You need to configure an access solution to meet the following requirements:

Users in adatum.com must be able to access resources in contoso.com.

Users in adatum.com must be prevented from accessing resources in fabrikam.com.

Users in both contoso.com and fabrikam.com must be prevented from accessing resources in adatum.com.

What should you create?

- A. a one-way realm trust from contoso.com to adatum.com
- B. a one-way realm trust from adatum.com to contoso.com
- C. a one-way external trust from contoso.com to adatum.com
- D. a one-way external trust from adatum.com to contoso.com

Correct Answer: C

The contoso domain must trust the adatum domain.

Note: In a One-way: incoming trust, users in your (trusted) domain can be authenticated in the other (trusting) domain. Users in the other domain cannot be authenticated in your domain.

Incorrect Answers:

A, B: Use realm trusts to form a trust relationship between a non-Windows Kerberos realm and a Windows Server domain.

D: The resources that are to be shared are in the contoso domain. References: Trust types

QUESTION 5

You have a Hyper-V host named Server1 that runs Windows Server 2012 R2. Server1 contains a virtual machine named VM1 that runs Windows Server 2012 R2.

You fail to start VM1 and you suspect that the boot files on VM1 are corrupt.

On Server1, you attach the virtual hard disk (VHD) of VM1 and you assign the VHD a drive letter of F.

You need to repair the corrupt boot files on VM1.

What should you run?

- A. bootrec.exe /rebuildbcd
- B. bootrec.exe /scanos
- C. bcdboot.exe f:\windows /s c:
- D. bcdboot.exe c:\windows /s f:

Correct Answer: D

Enables you to quickly set up a system partition, or to repair the boot environment located on the system partition. The system partition is set up by copying a simple set of Boot Configuration Data (BCD) files to an existing empty partition.

Parameter	Description
source	Specifies the location of the Windows directory to use as the source for copying boot environment files.
/l	Specifies the locale. The default locale is US English.
/s	Specifies the volume letter of the system partition. The default is the system partition identified by the firmware.

The following example copies BCD files from the C:\Windows folder to a system partition on a secondary hard drive that will be used on another computer. The system partition on the secondary drive was assigned the volume letter S:

```
bcdboot C:\Windows /s S:
```

The following example creates boot entries on a USB flash drive with the volume letter F, including boot files to support either a BIOS-based computer:

```
bcdboot C:\Windows /s F: /f ALL
```

Reference: BCDboot Command-Line Options
