**QUESTION 1**

Your network contains an Active Directory domain named contoso.com. The domain contains a Microsoft Application Virtualization (App-V) 5.0 infrastructure. You package two complex applications named App1 and App2. You create a connection group that contains App1 and App2.

You discover that App2 overwrites some of the registry settings used by App1.

You need to recommend a solution for the deployment of App1 and App2 to meet the following requirements:

Prevent App2 from overwriting the registry settings of App1.

Ensure that App1 and App2 can share information.

What should you recommend? More than one answer choice may achieve the goal. Select the BEST answer.

- A. Change the order of packages in the package library.
- B. Modify the PackageId of App1.
- C. Change the order of packages in the connection group.
- D. Create a single package that contains App1 and App2.
- E. Modify the VersionId of App1.

Correct Answer: C

<http://blogs.technet.com/b/appv/archive/2012/11/06/deploying-connection-groups-app-v-5-0.aspx> Note: The order of packages in the connection group is important. This determines the order in which the package contents are merged. So, in the following case, if there was a conflict (example: same registry value), the content of the "App1" package would be used.

QUESTION 2

Your network contains an Active Directory domain named adatum.com. The domain contains a server named Server1 that runs Windows Server 2012.

You need to prevent all of the applications that run on Server1 from running code from non-executable memory regions.

What should you do?

- A. From the local Group Policy, create an application control policy.
- B. From BCDEdit, modify the Data Execution Prevention (DEP) settings.
- C. From Windows PowerShell, run the Set-ExecutionPolicy cmdlet.
- D. From the local Group Policy, create a software restriction policy.

Correct Answer: B

QUESTION 3

Your network contains servers that run Windows Server 2012 and client computers that run Windows 8.

You plan to use Microsoft Application Virtualization (App-V) 5.0 as an application virtualization platform.

You have an application named App1. App1 requires a system restart during its installation. You install the App-V Sequencer on a client computer named CL1 that runs Windows 8.

You need to sequence App1.

Which three actions should you perform? To answer, move the three appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Select and Place:

Actions	Answer Area
Restart the App-V Sequencer and select Modify an Existing Virtual Application Package . Update the App1.appv package.	
From the App-V Sequencer, select App1.exe as an installer for the new virtual application package.	
Run an installation of App1.exe and complete the installation.	
Restart CL1.	
From the App-V Sequencer, select I am finished installing .	

Correct Answer:

Actions	Answer Area
Restart the App-V Sequencer and select Modify an Existing Virtual Application Package . Update the App1.appv package.	From the App-V Sequencer, select App1.exe as an installer for the new virtual application package.
	Run an installation of App1.exe and complete the installation.
	From the App-V Sequencer, select I am finished installing .
Restart CL1.	

Box 1: From the App-V Sequencer, select App1.exe as an installer for the new virtual application package.

Box 2: Run an installation of App1.exe and complete the installation.

Box 3: From the App-V Sequencer, select I am finished installing.

QUESTION 4

Your network contains an Active Directory domain named contoso.com. The domain contains two member servers named Server1 and Server2. Server1 and Server2 have the Hyper-V server role installed. Server2 is configured as Hyper-V replica of Server1.

Server1 hosts two virtual desktops named VM1 and VM2. VM1 and VM2 are replicated to Server2.

VM1 and VM2 host a distributed application named App1. App1 has its own authentication mechanism.

You need to verify whether the replicated virtual machines are configured properly. The solution must maintain the availability of App1.

Which three actions should you perform? To answer, move the three appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Select and Place:

Actions	Answer Area
Create a virtual switch on Server1.	
On the replicas of VM1 and VM2, modify the network adapter settings.	
On the replicas of VM1 and VM2, invoke Test Failover.	
On VM1 and VM2, modify the network adapter settings.	
Create a virtual switch on Server2.	
On VM1 and VM2, invoke a planned failover.	

Correct Answer:

Actions	Answer Area
Create a virtual switch on Server1.	Create a virtual switch on Server2.
	On the replicas of VM1 and VM2, modify the network adapter settings.
On VM1 and VM2, modify the network adapter settings.	On the replicas of VM1 and VM2, invoke Test Failover.
On VM1 and VM2, invoke a planned failover.	

QUESTION 5

Your company has a main office and two branch offices. The branch offices connect to the main office by using a slow WAN link.

You plan to deploy applications to all of the offices by using Microsoft Application Visualization (App-V) 5.0 streaming.

You need to recommend the server placement for the planned infrastructure.

What should you recommend? More than one answer choice may achieve the goal. Select the BEST answer.

- A. In the main office, deploy a management server, a database server, and a publishing server. In the branch offices, deploy a publishing server.
- B. In the main office, deploy a database server and a publishing server. In the branch offices, deploy a management server, a database server, and a publishing server.
- C. In the main office, deploy a management server, a database server, and a publishing server. In the branch offices, deploy a database server.
- D. In each office, deploy a management server, a database server, and a publishing server.

Correct Answer: A
