- 365 Days Free Update
- 800,000+ Satisfied Customers

QUESTION 1

Your network contains an Active Directory domain named contoso.com. The domain contains 500 client computers that run Windows 8.

You plan to deploy two applications named App1 and App2 to the client computers. App2 is updated by the application manufacturer every month.

The solution must meet the following requirements:

The executable files of App1 must NOT be stored on the client computers. Users who run App2 must run the latest version of App2 only.

What should you recommend using to deploy the applications?

- A. RemoteApp programs
- B. Microsoft Enterprise Desktop Virtualization (MED-V)
- C. Microsoft Application Virtualization (App-V) in standalone mode
- D. A Group Policy software distribution package assigned to the computer accounts

Correct Answer: A

Note:

*

RemoteApp enables you to make programs that are accessed remotely through Remote Desktop Services appear as if they are running on the end user's local computer. These programs are referred to as RemoteApp programs. Instead of being presented to the user in the desktop of the Remote Desktop Session Host (RD Session Host) server, the RemoteApp program is integrated with the client's desktop. The RemoteApp program runs in its own resizable window, can be dragged between multiple monitors, and has its own entry in the taskbar. If a user is running more than one RemoteApp program on the same RD Session Host server, the RemoteApp program will share the same Remote Desktop Services session.

Incorrect: Not B:

*

The App-V clients may also be used in a "stand-alone" mode without either of the server infrastructures. In this case, the sequenced packages are delivered using an external technique, such as an Electronic Software Delivery system or manual deployment.

*

Microsoft Application Virtualization (MS App-V) platform allows applications to be deployed ("streamed") in real-time to any client from a virtual application server. It removes the need for traditional local installation of the applications, although a standalone deployment method is also supported. With a streaming-based implementation, the App-V client needs to be installed on the client machines and application data that is stored on the virtual application server is installed (streamed) to the client cache on demand when it is first used, or pre-installed in a local cache.

QUESTION 2

You are an enterprise administrator for your company, which is named Contoso, Ltd.

You plan to publish applications to virtual desktops by using Microsoft Application Virtualization (App-V) 5.0. You need to recommend a solution to prevent the virtual desktops from caching App-V 5.0 packages to disk.

What should you include in the recommendation?

- A. Dynamic Memory
- B. Non-uniform memory access (NUMA)
- C. A dynamic user configuration file
- D. Shared Content Store Mode

Correct Answer: D

QUESTION 3

Your network contains an Active Directory domain named contoso.com. All client computers run Windows 7.

You plan to upgrade all of the client computers to Windows 8.

You install the Microsoft Application Compatibility Toolkit (ACT) on a server named Server1.

You configure Server1 to host the Log Processing Service shared folder,

You need to recommend which permissions must be assigned to the Log Processing Service shared folder. The solution must provide the least amount of permissions to the shared folder.

Which permissions should you recommend assigning to the Everyone group on the shared folder? (Each correct answer presents part of the solution. Choose all that apply.)

- A. Write NTFS permissions
- B. Read NTFS permissions
- C. Change Share permissions
- D. Read NTFS permissions and Execute NTFS permissions
- E. Read Share permissions

Correct Answer: ACE

<http://technet.microsoft.com/en-us/library/hh824812.aspx> The Everyone group must have Change and Read permissions to the ACT LPS share. The Everyone group must have Write access to the ACT LPS share.

QUESTION 4

Your network contains an Active Directory domain named contoso.com.

You use Microsoft Application Virtualization (App-V) 5.0 to package and deploy applications to the network.

You need to deploy an application named App1. The solution must ensure that an add-on for App1 is also installed.

Which five actions should you perform? To answer, move the five appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Select and Place:

Actions	Answer Area
Create a connection group.	
Sequence the add-on.	
Sequence App1.	
Publish the packages.	
Add the packages to the publishing server.	
Publish the connection group.	

Correct Answer:

Actions	Answer Area
	Sequence App1.
	Sequence the add-on.
	Add the packages to the publishing server.
Publish the packages.	Create a connection group.
	Publish the connection group.

Box 1: Sequence App1

First sequence the application.

Box 2: Sequence the add-on

Then sequence the add-on.

Box 3: Add the packages to the publishing server.

Box 4: Create a connection group.

App1 and the add-on are added to the connection group.

Box 5: Publish the connection group.

Note:

- * At a high level, virtual applications management with Configuration Manager requires sequencing applications, distributing virtual applications to end-users and client devices using Configuration Manager deployments, and finally, publishing those applications for use.
- * Connection Groups group one or more App-V packages to enable member applications in these packages to interact with one another while maintaining isolation from the rest of the system. This gives sequencing engineers the flexibility to maintain packages independently and removes the redundancy of adding the same application several times onto a machine.
- * The Microsoft Application Virtualization (App-V) 5.0 Sequencer enables you to create the following three types of virtualized application packages: Standard application Add-on or plug-in Middleware

QUESTION 5

You have a Microsoft Application Virtualization (App-V) publishing server named Server1. Some users connect to the network by using a cellular connection.

You need to prevent the users from downloading App-V packages the first time they run the application that is associated to the package.

What should you do? More than one answer choice may achieve the goal. Select the BEST answer.

- A. From a Group Policy object (GPO), configure the App-V Streaming settings.
- B. From a Group Policy object (GPO), configure the App-V Publishing settings.
- C. From each client computer, run the Set-AppvClientConfiguration cmdlet.
- D. From each client computer, run the Set-AppvClientPackage cmdlet.

Correct Answer: A
