**QUESTION 1**

You administer a Microsoft SQL Server database.

You want to import data from a text file to the database.

You need to ensure that the following requirements are met:

Data import is performed from a Windows batch file.

Data is loaded as a unit and is minimally logged.

Which data import command and recovery model should you choose? (To answer, drag the appropriate data import command or recovery model to the appropriate location or locations in the answer area. Answer choices may be used once, more than once, or not at all. Answer targets may be used once or not at all. Additionally, you may need to drag the split bar between panes or scroll to view content.)

Select and Place:

Command/Recovery Model Name	Command/Recovery Model
BCP	Data import command
BULK INSERT	Recovery model
Bulk-logged	
OPENDATASOURCE	
Full	

Correct Answer:

Command/Recovery Model Name	Command/Recovery Model
BCP	Data import command
	Recovery model
OPENDATASOURCE	
Full	

BULK INSERT

Bulk-logged

**QUESTION 2**

You are developing a SQL Server Integration Services (SSIS) project by using the Project Deployment Model.

The project is deployed to a single SSIS catalog, and transfers data to and from multiple databases hosted on SQL Server.

The project must be configured to be able to export data to and from five different production servers that run SQL Server 2012. Each target server requires different values for connection strings and parameters in the SSIS project.

You need to meet the requirements by using the least amount of administrative effort.

- A. For each target server, create separate Environments in the SSIS catalog of the host SQL Server SSIS instance. Select the appropriate Environment at package execution time.
- B. Create one SSIS catalog Environment. Change the values of each Environment variable at package execution time.
- C. For each target server, create separate registry entry configurations. Select the registry entry at package execution time.
- D. For each target server, create a separate XML configuration file. Select the XML configuration file at package execution time.

Correct Answer: A

QUESTION 3

You are preparing to install SQL Server 2012 Master Data Services (MDS),

You need to ensure that the database requirements are met.

- A. Microsoft SharePoint Server 2010 Enterprise Edition SP1
- B. SQL Server 2012 Data Center (64-bit) x64 on the database server
- C. SQL Server 2012 Enterprise (64-bit) x64 on the database server
- D. SQL Server 2012 Standard (64-bit) x64 on the database server

Correct Answer: C

QUESTION 4

You are designing a data warehouse with two fact tables. The first table contains sales per month and the second table contains orders per day.

Referential integrity must be enforced declaratively.

You need to design a solution that can join a single time dimension to both fact tables.

What should you do?

- A. Create a surrogate key for the time dimension.
- B. Join the two fact tables.
- C. Create a view on the sales table.
- D. Create a time dimension that can join to both fact tables at their respective granularity.

Correct Answer: A

With dimensionally modeled star schemas or snowflake schemas, decision support queries follow a typical pattern: the query selects several measures of interest from the fact table, joins the fact rows with one or several dimensions along the surrogate keys, places filter predicates on the business columns of the dimension tables, groups by one or several business columns, and aggregates the measures retrieved from the fact table over a period of time. The following demonstrates this pattern, which is also sometimes referred to as a star join query: `select ProductAlternateKey, CalendarYear, sum(SalesAmount) from FactInternetSales Fact join DimTime on Fact.OrderDateKey = TimeKey join DimProduct on DimProduct.ProductKey = Fact.ProductKey where CalendarYear between 2003 and 2004 and ProductAlternateKey like '\\BK%\\' group by ProductAlternateKey, CalendarYear`

QUESTION 5

You administer a Microsoft SQL Server 2012 instance that contains a financial database hosted on a storage area network (SAN). The financial database has the following characteristics:

A data file of 2 terabytes is located on a dedicated LUN (drive D).

A transaction log of 10 GB is located on a dedicated LUN (drive E).

Drive D has 1 terabyte of free disk space.

Drive E has 5 GB of free disk space.

The database is continually modified by users during business hours from Monday through Friday between 09:00 hours and 17:00 hours. Five percent of the existing data is modified each day.

The Finance department loads large CSV files into a number of tables each business day at 11:15 hours and 15:15 hours by using the BCP or BULK INSERT commands. Each data load adds 3 GB of data to the database.

These data load operations must occur in the minimum amount of time.

A full database backup is performed every Sunday at 10:00 hours. Backup operations will be performed every two hours (11:00, 13:00, 15:00, and 17:00) during business hours.

You need to ensure that your backup will continue if any invalid checksum is encountered.

- A. Differential
- B. Transaction log
- C. FULL
- D. SIMPLE
- E. BULK_LOGGED

F. SKIP

G. RESTART

H. STANDBY

I. CHECKSUM

J. DBO_ONLY

K. COPY_ONLY

L. NORECOVERY

M. NO_CHECKSUM

N. CONTINUE_AFTER_ERROR

Correct Answer: N
