**QUESTION 1**

You need to recommend a solution that addresses the installation issues. What should you include in the recommendation?

- A. Windows logins
- B. Server roles
- C. Contained users
- D. Database roles

Correct Answer: C

*

Scenario: Installation Issues

The current version of the ERP application requires that several SQL Server logins be set up to function correctly. Most customers set up the ERP application in multiple locations and must create logins multiple times.

*

Creating contained users enables the user to connect directly to the contained database. This is a very significant feature in high availability and disaster recovery scenarios such as in an AlwaysOn solution. If the users are contained users,

in case of failover, people would be able to connect to the secondary without creating logins on the instance hosting the secondary. This provides an immediate benefit.

QUESTION 2

You have a SQL Server 2014 database named DB1.

You plan to import a large number of records from a SQL Azure database to DB1.

You need to recommend a solution to minimize the amount of space used in the transaction log during the import operation.

What should you include in the recommendation?

- A. The bulk-logged recovery model
- B. The full recovery model
- C. A new partitioned table
- D. A new log file
- E. A new file group

Correct Answer: A

Compared to the full recovery model, which fully logs all transactions, the bulk-logged recovery model minimally logs bulk operations, although fully logging other transactions.

The bulk-logged recovery model protects against media failure and, for bulk operations, provides the best performance and least log space usage.

Note:

The bulk-logged recovery model is a special-purpose recovery model that should be used only intermittently to improve the performance of certain large-scale bulk operations, such as bulk imports of large amounts of data.

Reference: Recovery Models (SQL Server)

QUESTION 3

You have a SQL Azure database named Database1.

You need to design the schema for a table named table1. Table1 will have less than one million rows. Table1 will contain the following information for each row:

Column	Description
ID	An incremental numeric value used to identify the row
Name	A string in English
Code	An alphanumeric code that has five characters
ModifiedDate	The date of the last modification

The solution must minimize the amount of space used to store each row.

Which data types should you recommend for each column? To answer, drag the appropriate data type to the correct column in the answer area.

Select and Place:

Data Types	Answer Area
int	ID <input type="text" value="Data type"/>
bigint	Name <input type="text" value="Data type"/>
varchar	Code <input type="text" value="Data type"/>
nvarchar	ModifiedDate <input type="text" value="Data type"/>
char	
smalldatetime	
date	

Correct Answer:

Data Types		Answer Area
	ID	int
bigint	Name	varchar
	Code	char
nvarchar	ModifiedDate	date
smalldatetime		

<http://msdn.microsoft.com/en-US/library/ms187752.aspx>

QUESTION 4

You plan to deploy SQL Server 2012.

You are designing two stored procedures named USP_1 and USP_2 that have the following requirements:

Prevent data read by USP_1 from being modified by other active processes.

Prevent USP_2 from performing dirty reads.

You need to recommend the isolation level for each stored procedure. The solution must maximize concurrency.

Which isolation levels should you recommend? To answer, drag the appropriate isolation level to the correct stored procedure in the answer area.

Select and Place:

Isolation Levels	Answer Area
<input type="text" value="read committed"/>	USP_1 <input type="text" value="Isolation Level"/>
<input type="text" value="read uncommitted"/>	USP_2 <input type="text" value="Isolation Level"/>
<input type="text" value="repeatable read"/>	
<input type="text" value="serializable"/>	

Correct Answer:

Isolation Levels	Answer Area
<input type="text"/>	USP_1 <input type="text" value="repeatable read"/>
<input type="text" value="read uncommitted"/>	USP_2 <input type="text" value="read committed"/>
<input type="text"/>	
<input type="text" value="serializable"/>	

Note:

* REPEATABLE READ This isolation level includes the guarantees given by SNAPSHOT isolation level. In addition, REPEATABLE READ guarantees that for any row that is read by the transaction, at the time the transaction commits the row has not been changed by any other transaction. Every read operation in the transaction is repeatable up to the end of the transaction.

* Committed Read is SQL Server's default isolation level. It ensures that an operation will never read data another application has changed but not yet committed.

QUESTION 5

You need to recommend a solution to minimize the amount of time it takes to execute USP_1. With what should you recommend replacing Table1?

- A. A view
- B. A temporary table
- C. A table variable

D. A function

Correct Answer: A

* A stored procedure named USP_1 generates millions of rows of data for multiple reports. USP_1 combines data from five different tables from the Sales and Customers databases in a table named Table1.
