-  **800,000+** Satisfied Customers

QUESTION 1

ReportApp will shut down every night. However, data from the searches performed during the night must still be collected.

Based on the security requirements, which line of code should you insert into the WebApiConfig file? To answer, select the appropriate options in the answer area.

Hot Area:

Answer Area

Correct Answer:

Answer Area

Scenario: The Web API must only accept one data format.

The MVC front-end layer and the Web API will communicate by using JSON.

The most common approach to support JSON only is to clear other formatters and leave only JsonMediaTypeFormatter around.

Given an instance of HttpConfiguration you'd simply clear all and re-add

JsonMediaTypeFormatter:

```
configuration.Formatters.Clear();
```

```
configuration.Formatters.Add(new JsonMediaTypeFormatter());
```

QUESTION 2

DRAG DROP

You need to modify the ExecuteCommandProcedure() method to meet the technical requirements.

You have the following code:

```
private async Task ExecuteCommandProcedure (EntityCommand command)
{
    using (EntityConnection connection
    =new EntityConnection ("ExternalOrdersEntities"))
    {
        command.Connection = connection;
        Target 1
        Target 2
    }
}
```

Which code segments should you include in Target 1 and Target 2 to complete the code? (To answer, drag the appropriate code segments to the correct location in the answer area. Each segment may be used once, more than once, or not

at all. You may need to drag the split bar between panes or scroll to view content.)

NOTE: Each correct selection is worth one point.

Select and Place:

Answer Area

```
private async Task ExecuteCommandProcedure(EntityCommand command)
{
    using (EntityConnection connection
    = new EntityConnection("name=ExternalOrdersEntities"))
    {
        command.Connection = connection;
        [Target 1]
        [Target 2]
    }
}
```

Correct Answer:

```
Answer Area
private async Task ExecuteCommandProcedure(EntityCommand command)
{
    using (EntityConnection connection
        = new EntityConnection("name=ExternalOrdersEntities"))
    {
        command.Connection = connection;
        await connection.OpenAsync();

        await command.QueryAsync();
    }
}
```

Synchronous to Asynchronous Connection Open You can upgrade an existing application to use the new asynchronous feature. For example, assume an application has a synchronous connection algorithm and blocks the UI thread every time it connects to the database and, once connected, the application calls a stored procedure that signals other users of the one who just signed in.

When converted to use the new asynchronous functionality, the program would look like: `await conn.OpenAsync();`
`await cmd.ExecuteNonQuery();`

QUESTION 3

You need to configure DNS for the Event service. How many DNS entries should you create?

- A. 1
- B. 2
- C. 3
- D. 4

Correct Answer: C

Scenario: Regional access to the Event Service API

Data for partners in Germany and Brazil must be served from Azure datacenters in their respective geographies unless there is a regional Azure outage. All other partners must use the US West Azure datacenter.

QUESTION 4

DRAG DROP

You are developing an application to consolidate data from existing databases. Each database has a different structure. The existing databases cannot be changed. The application will use a new database to store the consolidated information.

You need implement the following data providers:

Data provider	Requirements
One	This provider requires mapping of code objects to an existing database.
Two	This provider requires the use of a TableAdapter object.
Three	This provider must allow the use of queries that are provided from URLs.

Which technologies should you use? To answer, drag the appropriate technologies to the correct data providers. Each technology may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to

view content.

NOTE: Each correct selection is worth one point.

Select and Place:

Technologies

- ADO.NET
- LINQ to XML
- Entity Framework
- WCF Data Services

Answer Area

Data provider

One

Two

Three

Technology

Technology

Technology

Technology

Correct Answer:

Technologies

-
- LINQ to XML
-
-

Answer Area

Data provider

One

Two

Three

Technology

ADO.NET

Entity Framework

WCF Data Services

Box 1: ADO.Net

ADO.NET provides consistent access to data sources such as SQL Server and XML, and to data sources exposed through OLE DB and ODBC.

Box 2: Entity Framework

Data access is an important part of almost any software application. ASP.NET Core supports a variety of data access options, including Entity Framework Core (and Entity Framework 6 as well), and can work with any .NET data access framework.

Box 3: WCP Data services

WCF Data Services (formerly known as "ADO.NET Data Services") is a component of the .NET Framework that enables you to create services that use the Open Data Protocol (OData) to expose and consume data over the Web or intranet

by using the semantics of representational state transfer (REST). OData exposes data as resources that are addressable by URIs.

Incorrect Answers:

LINQ to XML is like the Document Object Model (DOM) in that it brings the XML document into memory. You can query and modify the document, and after you modify it you can save it to a file or serialize it and send it over the Internet.

The most important advantage of LINQ to XML is its integration with Language-Integrated Query (LINQ). This integration enables you to write queries on the in-memory XML document to retrieve collections of elements and attributes.

QUESTION 5

You are creating a streamed Windows Communication Foundation (WCF) service. You implement the following service methods.

```
[ServiceContract]
public interface IEmployee
{
    [OperationContract]
    Stream EmployeeMethod1(string string1);

    [OperationContract]
    bool EmployeeMethod2(Message msg1);

    [OperationContract]
    IXmlSerializable EmployeeMethod3(Stream stream1, string string1);

    [OperationContract]
    int EmployeeMethod4(bool booll, Message msg1);
}
```

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

Hot Area:

Answer Area

Statement	Yes	No
The input for EmployeeMethod3 is streamed.	<input type="radio"/>	<input type="radio"/>
The output for EmployeeMethod3 is streamed.	<input type="radio"/>	<input type="radio"/>
The input for EmployeeMethod4 is streamed.	<input type="radio"/>	<input type="radio"/>
The output for EmployeeMethod4 is streamed.	<input type="radio"/>	<input type="radio"/>

Correct Answer:

Answer Area

Statement	Yes	No
The input for EmployeeMethod3 is streamed.	<input type="radio"/>	<input checked="" type="radio"/>
The output for EmployeeMethod3 is streamed.	<input checked="" type="radio"/>	<input type="radio"/>
The input for EmployeeMethod4 is streamed.	<input type="radio"/>	<input checked="" type="radio"/>
The output for EmployeeMethod4 is streamed.	<input type="radio"/>	<input checked="" type="radio"/>
