### QUESTION 1

You are developing a self-hosted WCF service that returns stock market information.

The service must be discoverable by any client application.

You need to build the service host.

How should you build the host? (To answer, drag the appropriate code segments to the correct location or locations in the answer area. Each code segment may be used once, more than once, or not at all. You may need to drag the split bar

between panes or scroll to view content.)

Select and Place:

```
static void Main(string[] args)
{
    Uri StockURI = new Uri("http://localhost:8733/StockTicker");
    var mytype = typeof(StockTickerService);

    using (  host
           = new  (mytype, StockURI)
        {
            host.AddServiceEndpoint(typeof(IStockTickerService),
                new WSHttpBinding(), "");

            host.Description.Behaviors.Add(new  ());

            host.AddServiceEndpoint(new  ());

            host.Open();
            Console.ReadLine();
            host.Close();
        }
}
```

Correct Answer:

Answer Area

```
static void Main(string[] args)
{
    Uri StockURI = new Uri("http://localhost:8733/StockTicker");
    var mytype = typeof(StockTickerService);

    using ( ServiceHost host
           = new ServiceHost (mytype, StockURI)
           {
               host.AddServiceEndpoint (typeof (IStockTickerService),
                                       new WSHttpBinding (), "");

               host.Description.Behaviors.Add (new ServiceDiscoveryBehavior ());

               host.AddServiceEndpoint (new UdpDiscoveryEndpoint ());

               host.Open ();
               Console.ReadLine ();
               host.Close ();
           }
    )
    {
    }
}
```

UdpDiscoveryEndpoint  
DiscoveryEndpoint  
ServiceBehaviorAttribute  
ServiceDiscoveryBehavior  
ServiceHost

## QUESTION 2

You need to create an OData query expression to return the ten books with the smallest number of sales. Which query expression should you use?

- A. /books?orderby=sales descand\$count=10
- B. /search?orderby=sales ascand\$count=10
- C. /search?orderby=sales descand\$top=10
- D. /books?orderby=sales ascand\$top=10

Correct Answer: D

The get the smallest number of sales we should use ascending (asc) ordering.

From scenario: RESTful API endpoints include: Action: Get a list of all books HTTP method: GET Relative URI: /books

## QUESTION 3

You are developing a web application by using Microsoft .NET Framework 4.5.

You are creating a web client for the application. The web client will make REST calls to several web services.

You need to ensure that the web client meets the following requirements:

Uses the Task class to perform asynchronous operations Reuses recently resolved DNS lookups

Which object should you include in the solution?

- A. ServiceClient
- B. WebClient
- C. HttpClient
- D. WebRequest

Correct Answer: C

---

#### QUESTION 4

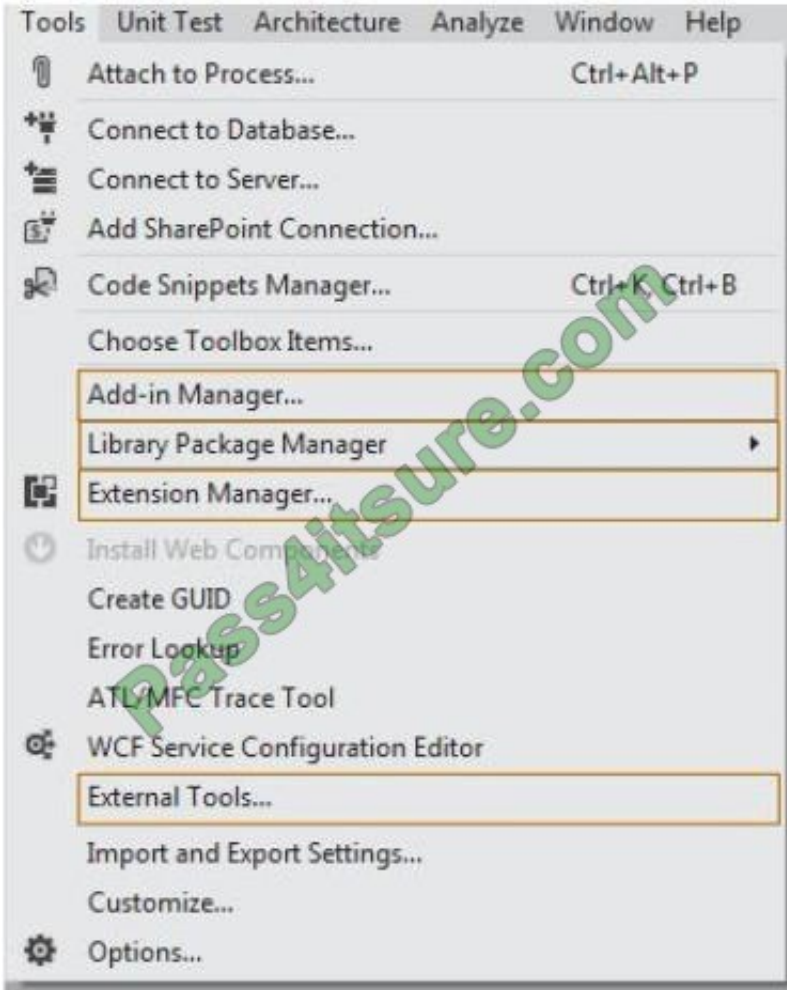

You are supporting an application that uses the ADO.NET Entity Framework to query and access data.

The latest version of Entity Framework contains bug fixes that will improve performance.

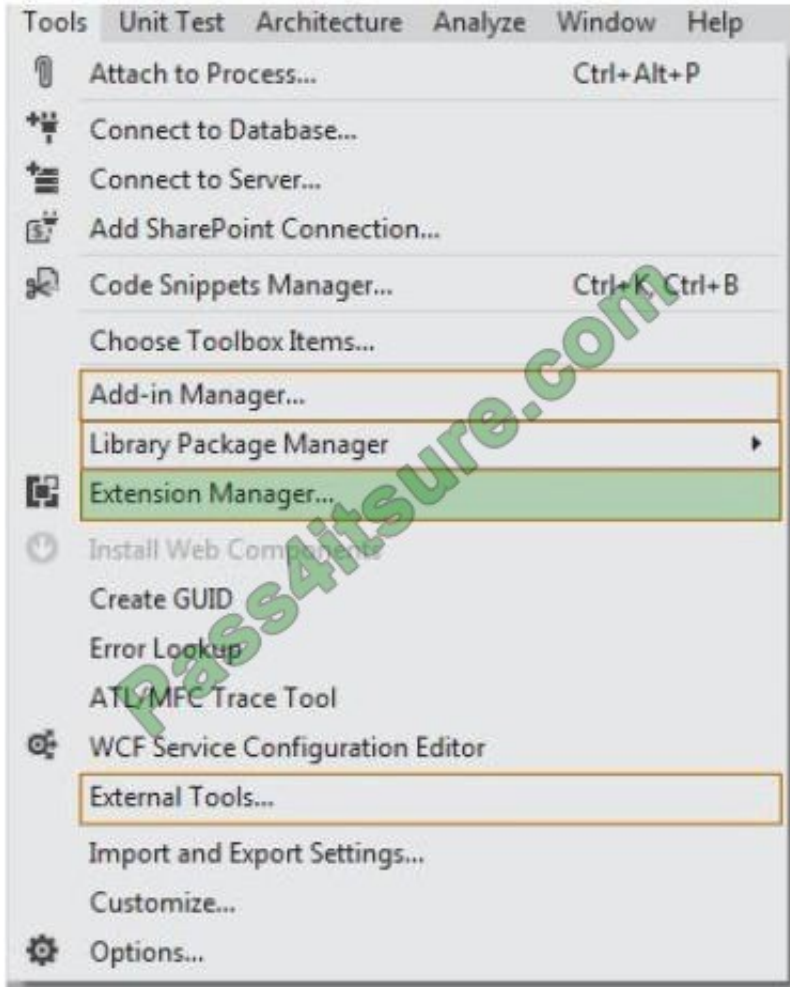

You need to update Entity Framework.

Which Visual Studio 2012 menu item should you choose? (To answer, select the appropriate menu item in the answer area.)

Hot Area:

Correct Answer:

## QUESTION 5

You are developing a library management application that uses the ADO.NET Entity Framework against a SQL Server database. The application has a method that returns check outs filtered by date. The Book class is shown below.

```
public partial class Book
{
    ...
    public Nullable<System.DateTime> CheckoutDate { get; set; }
    ...
}
```

You must filter the data on the SQL server before it is returned to the application server.

You need to return books checked out more recently than the entered date.

Which code segment should you use?

- A. `IQueryable<Book> books = db.Books;  
books = books.Where(b => b.CheckoutDate >= date);`
- B. `IEnumerable<Book> books = db.Books.ToList().AsQueryable();  
books = books.Where(b => b.CheckoutDate >= date);`
- C. `IQueryable<Book> books = db.Books.ToList().AsQueryable();  
books = books.Where(b => b.CheckoutDate >= date);`
- D. `IEnumerable<Book> books = db.Books;  
books = books.Where(b => b.CheckoutDate >= date);`

A. Option A

B. Option B

C. Option C

D. Option D

Correct Answer: A

The difference is that IQueryable is the interface that allows LINQ-to-SQL (LINQ.-to- anything really) to work. So if you further refine your query on an IQueryable, that query will be executed in the database, if possible. For the IEnumerable case, it will be LINQ-to-object, meaning that all objects matching the original query will have to be loaded into memory from the database.
