QUESTION 1

You use Microsoft .NET Framework 4 to create a Windows Presentation Foundation (WPF) application. You write the following code fragment.

```
<Window x:Class="MyProject.MainWindow" xmlns:local="clr-namespace:MyProject">
  <Window.Resources>
    <local:AverageConverter x:Key="avgConverter" />
  </Window.Resources>
<StackPanel Orientation="Vertical">
  <Slider x:Name="sld01" Minimum="0" Maximum="100" />
  <Slider x:Name="sld02" Minimum="0" Maximum="50" />
  <Slider x:Name="sld03" Minimum="0" Maximum="50" />
  <TextBlock>
    <TextBlock.Text>
      <MultiBinding Converter="{StaticResource avgConverter}">
        <Binding ElementName="sld01" Path="Value" />
        <Binding ElementName="sld02" Path="Value" />
        <Binding ElementName="sld03" Path="Value" />
      </MultiBinding>
    </TextBlock.Text>
  </TextBlock>
</StackPanel>
</Window>
```

You need to implement the `MyProject.AverageConverter` class. What should you do?

- A. Inherit from the `TypeConverter` class.
- B. Implement the `IValueConverter` interface.
- C. Apply the `TypeConverterAttribute` attribute.
- D. Implement the `IMultiValueConverter` interface.

Correct Answer: D

QUESTION 2

You are developing a Windows Presentation Foundation (WPF) application for managing student information. You place a `Button` control named `btnSort` and a `DataGrid` control named `dgStudents` on the design surface of the `MainWindow.xaml` file. You create a `Student` class with two properties: `FirstName` and `LastName`. You create the following code segment in the constructor of the main window.

```
Students = New List(Of Student) (  
    New Student() {  
        New Student() With { .FirstName = "Nicole", _  
            .LastName = "Holliday"  
        }  
    }  
)
```

The DataGridView control displays the list of students unsorted.

You need to ensure that the list of students is sorted by last name.

Which code segment should you add to the click event handler of the Button control?

- A. Dim sortedStudents As IEnumerable(Of Student) = Students.OrderBy(Function(s) s.LastName).ToList()
dgStudents.ItemsSource = sortedStudents
- B. Students.Sort() dgStudents.ItemsSource = Students
- C. Dim sortedStudents As IEnumerable(Of Student) Students.orderBy (Function (s) s.LastName)
dgStudents.ItemsSource = sortedStudents
- D. Students.Reversed dgStudents.ItemsSource = Students

Correct Answer: A

QUESTION 3

You use Microsoft .NET Framework 4 to create a Windows Presentation Framework (WPF) application.

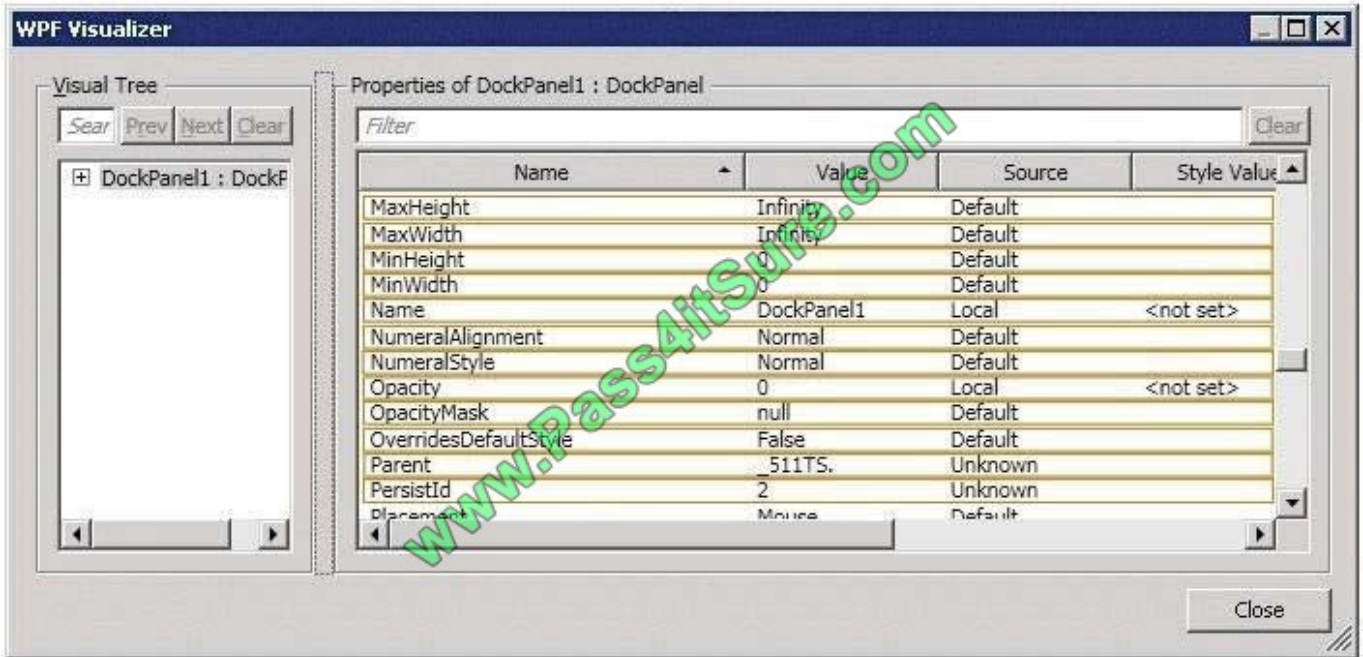

The application contains a DockPanel named DockPanel1. DockPanel1 contains a ListBox named List1 and a Button named Button1.

You discover that DockPanel1 does not appear in the application.

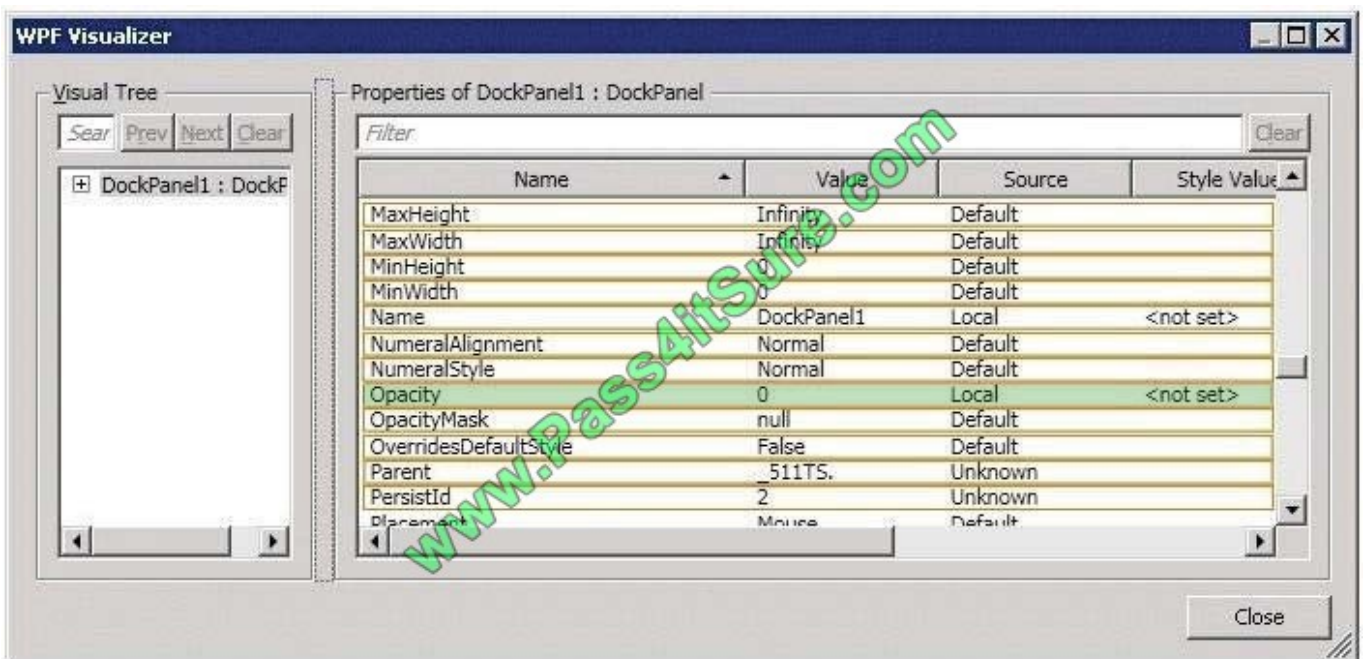

You set a breakpoint, and then you run the code in debug mode.

You need to identify which property prevents DockPanel1 from appearing in the application. Which property should you identify? (To answer, select the appropriate property in the answer area.)

Hot Area:

Correct Answer:

QUESTION 4

You are developing a Windows Presentation Foundation (WPF) application that displays opportunities from List named Leads, where T is a class named Lead. The Lead class contains the properties Title and Revenue.

You add a DataGrid control named dgQualifiedLeads to the MainWindow.xaml file. You set the ItemSource property of dgQualifiedLeads to Leads as follows. (Line numbers are included for reference only.)

```
01 ICollectionView Leads;  
02 public MainWindow()  
03 {  
04     InitializeComponent();  
05     Leads = CollectionViewSource.GetDefaultView(  
06         new List<Lead>(  
07             new Lead[]  
08                 {  
09                     new Lead() {Title="Title1", Revenue=1250.78d},  
10                     new Lead() {Title="Title2", Revenue=500.00d},  
11                     new Lead() {Title="Title3", Revenue=2300.33d},  
12                     new Lead() {Title="Title4", Revenue=2989.09d},  
13                     new Lead() {Title="Title5", Revenue=1500.21d},  
14                 }  
15             )  
16         );  
17     dgQualifiedLeads.ItemsSource = Leads;  
18  
19 }
```

You need to ensure that `CollectionViewSource` is used to filter the list to display only `Lead` objects with revenue of more than \$1,000. What should you do?

- A. Insert the following code at line 18.

```
Leads.Filter = new Predicate<object>(FilterOut);
```

Add the following code segment to the code-behind of the MainWindow.xaml file.

```
public bool FilterOut(object item)
{
    Lead lead = item as Lead;
    return (lead.Revenue > 1000d) ? false : true;
}
```

- B. Insert the following code at line 18.

```
Leads.Filter = new
    Predicate<object>((s) => ((Lead)s).Revenue > 1000d);
```

- C. Insert the following code at line 18.

```
Leads.SortDescriptions.Add(new SortDescription(
    "Revenue", ListSortDirection.Ascending));
```

- D. Insert the following code at line 18.

```
Leads.Filter = new Predicate<object>(FilterOut);
```

Add the following code segment to the code-behind of the MainWindow.xaml file.

```
public bool FilterOut(object item)
{
    Lead lead = item as Lead;
    return (lead.Revenue < 1000d) ? true : false;
}
```

A. Option A

B. Option B

C. Option C

D. Option D

Correct Answer: A

QUESTION 5

You are creating a Windows Presentation Foundation (WPF) application.

A control periodically appears to alert the user of status changes within the application.

You need to specify that each time the control appears, it fades out within half a second.

Which markup segment should you add to the Storyboard element of the control?

A.

B.

C.

D.

Correct Answer: C
