**QUESTION 1**

Note: This question is part of a series of questions that use the same or similar answer choices. An answer choice may be correct for more than one question in the series. Each question is independent of the other questions in this series.

Information and details provided in a question apply only to that question.

You need to get all of the deciles for a variable in a data frame.

What should you use?

- A. the Describe package
- B. the rxHistogram function
- C. the rxSummary function
- D. the rxQuantile function
- E. the rxCube function
- F. the summary function
- G. the rxCrossTabs function
- H. the ggplot2 package

Correct Answer: D

QUESTION 2

Note: This question is part of a series of questions that use the same or similar answer choices. An answer choice may be correct for more than one question in the series. Each question is independent of the other questions in this series.

Information and details provided in a question apply only to that question.

You need to calculate a measure of central tendency and variability for the variables in a dataset that is grouped by using another categorical variable.

What should you use?

- A. the Describe package
- B. the rxHistogram function
- C. the rxSummary function
- D. the rxQuantile function
- E. the rxCube function
- F. the summary function

G. the rxCrossTabs function

H. the ggplot2 package

Correct Answer: C

QUESTION 3

Note: This question is part of a series of questions that use the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is

exactly the same in each question in this series.

Start of repeated scenario

You are developing a Microsoft R Open solution that will leverage the computing power of the database server for some of your datasets.

You are performing feature engineering and data preparation for the datasets.

The following is a sample of the dataset.

```
rxGetInfo(df)
head(df)
```

	age	incwage	perwt	wkswork1	state
1	50	9000	30	48	Indiana
2	41	35000	20	48	Indiana
3	55	40400	21	52	Indiana
4	56	45000	30	52	Indiana
5	46	17200	60	52	Indiana
6	49	35000	21	52	Indiana

End of repeated scenario.

You have the following R code.

```
createRandomSample <- function(data)
{
  data$.rxRowSelection <- as.logical(rbinom(length(data[1]), 1.10)) return(data)
}
workers <- file.path(rxGetOption("sampleDataDir"), "Workers.xdf")
df <- rxXdfToDataFrame(file = workers, transformFunc = createRandomSample,
  transformVars = "age")
```

Which function determines the variable?

A. transformVars

- B. rxXdfDataFrame
- C. createRandomSample
- D. transformFunc

Correct Answer: A

QUESTION 4

You have a dataset that has multiple blocks and only numeric variables.

You are computing in a local compute context.

You plan to lag a variable named x to create a new variable named x_lagged by using a transform function. You will create a new element in the output of the function.

You need to minimize the number of missing values.

Which three actions should you perform? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. Assign a value to the first value of x_lagged in the current block.
- B. Use rxSet to store the last value of x_lagged in the current block.
- C. Use rxSet to store the last value of x in the current block.
- D. Use rxGet to retrieve the first value of x in the next block to be processed.
- E. Use rxGet to retrieve a value stored in processing of the prior block.

Correct Answer: ACD

QUESTION 5

You are planning the compute contexts for your environment.

You need to execute rx-function calls in parallel.

What are three possible compute contexts that you can use to achieve this goal? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

- A. local parallel
- B. Spark
- C. local sequential
- D. Map Reduce

E. SQL

Correct Answer: ABD
