**QUESTION 1**

You ingest data into a Microsoft Azure event hub.

You need to export the data from the event hub to Azure Storage and to prepare the data for batch processing tasks in Azure Data Lake Analytics.

Which two actions should you perform? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. Run the Avro extractor from a U-SQL script.
- B. Create an Azure Storage account.
- C. Add a shared access policy.
- D. Enable Event Hubs Archive.
- E. Run the CSV extractor from a U-SQL script.

Correct Answer: BD

QUESTION 2

You plan to use Microsoft Azure Event Hubs to ingest data. You plan to use Azure Stream Analytics to analyze the data in real time and to send the output directly to Azure Data Lake Store.

You discover duplicate records in the output data.

What is a possible cause of the duplicate records?

- A. There are connectivity issues with the output adapter.
- B. There is a connectivity issue between the data source and the event hub.
- C. There are multiple deliveries to the output adapter that writes the output events.
- D. The Stream Analytics output adapter writes the output events transactionally.

Correct Answer: A

QUESTION 3

Note: This question is part of a series of questions that present the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is

exactly the same in each question in this series.

Start of repeated scenario

You are migrating an existing on-premises data warehouse named LocalDW to Microsoft Azure. You will use an Azure SQL data warehouse named AzureDW for data storage and an Azure Data Factory named AzureDF for extract, transformation, and load (ETL) functions.

For each table in LocalDW, you create a table in AzureDW.

On the on-premises network, you have a Data Management Gateway.

Some source data is stored in Azure Blob storage. Some source data is stored on an on-premises Microsoft SQL Server instance. The instance has a table named Table1.

After data is processed by using AzureDF, the data must be archived and accessible forever. The archived data must meet a Service Level Agreement (SLA) for availability of 99 percent. If an Azure region fails, the archived data must be available for reading always. The storage solution for the archived data must minimize costs.

End of repeated scenario.

You need to define the schema of Table1 in AzureDF.

What should you create?

- A. a gateway
- B. a linked service
- C. a dataset
- D. a pipeline

Correct Answer: C

QUESTION 4

HOTSPOT

You have a Microsoft Azure Data Lake Analytics service.

You have a file named Employee.tsv that contains data on employees. Employee.tsv contains seven columns named Empld, Start, FirstName, LastName, Age, Department, and Title.

You need to create a Data Lake Analytics jobs to transform Employee.tsv, define a schema for the data, and output the data to a CSV file. The outputted data must contain only employees who are in the sales department. The Age column must allow NULL.

How should you complete the U-SQL code segment? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

@Employee =

```
EXTRACT EmpID      int,
        Start      DateTime,
        FirstName   string,
        LastName    string,
        Department  string,
        Title       string,
        Age
```

	▼
int	
int?	
string	

FROM "/Input/Data/Employee.tsv"

USING

	▼
Extractors.Csv();	
Extractors.Tsv();	
Outputters.Csv();	
Outputters.Tsv();	

@Rowset =

```
SELECT EmpId, Start, FirstName, LastName, Age, Department, Title
FROM @Employee
```

WHERE Department == "Sales";

OUTPUT @Rowset

TO "/Output/Employee.csv"

USING

	▼
Extractors.Csv();	
Extractors.Tsv();	
Outputters.Csv();	
Outputters.Tsv();	

Correct Answer:

Answer Area

@Employee =

```
EXTRACT EmpID      int,
        Start      DateTime,
        FirstName   string,
        LastName    string,
        Department  string,
        Title       string,
        Age
```

	▼
int	
int?	
string	

FROM "/Input/Data/Employee.tsv"

USING

	▼
Extractors.Csv();	
Extractors.Tsv();	
Outputters.Csv();	
Outputters.Tsv();	

@Rowset =

```
SELECT EmpId, Start, FirstName, LastName, Age, Department, Title
FROM @Employee
```

WHERE Department == "Sales";

OUTPUT @Rowset

TO "/Output/Employee.csv"

USING

	▼
Extractors.Csv();	
Extractors.Tsv();	
Outputters.Csv();	
Outputters.Tsv();

QUESTION 5

You have a Microsoft Azure SQL data warehouse. You have an Azure Data Lake Store that contains data from ORC,

RC, Parquet, and delimited text files.

You need to load the data to the data warehouse in the least amount of time possible.

Which two actions should you perform? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. Use Microsoft SQL Server Integration Services (SSIS) to enumerate from the Data Lake Store by using a for loop.
- B. Use AzCopy to export the files from the Data Lake Store to Azure Blob storage.
- C. For each file in the loop, export the data to Parallel Data Warehouse by using a Microsoft SQL Server Native Client destination.
- D. Load the data by executing the CREATE TABLE AS SELECT statement.
- E. Use bcp to import the files.
- F. In the data warehouse, configure external tables and external file formats that correspond to the Data Lake Store.

Correct Answer: DF
