Correct Answer: C

QUESTION 3

Which effect does applying a join in ArcMap to a layer and a stand-alone table have?

- A. It will create a new output feature class containing the layer and associated data
- B. It will temporarily append the associated data to the layer's attribute table
- C. It will permanently append the associated data to the layer's attribute table
- D. It will create a new output layer containing the layer and associated data

Correct Answer: A

**QUESTION 4**

An ArcGIS user is analyzing a map containing several high quality data layers. The layers are defined in several different coordinate systems in the same data frame. However, due to the high quality of the data, all features line up with each other almost exactly.

When the user adds a new dataset all features appear to shift to the north by a nearly identical distance. The new dataset is assigned to a different coordinate system than any of the layers that line up correctly.

What are two possible reasons for the features shifting? (Choose two)

- A. ArcMap's on-the-fly projection is introducing random error in the new dataset
- B. The new dataset is assigned to the wrong projected coordinate system
- C. The wrong geographic transformation is used to project the new dataset
- D. The new datasets geometry is more accurate than the other layers in the map
- E. The map projection required to project the new dataset is outdated

Correct Answer: AB
