**QUESTION 1**

A developer wants to create a new Explore based on the order_items view. The developer creates an

Explore in the ecommerce model file with the following definition:

```
explore: order_items {}
```

After saving and validations, the developer receives this LookML validator error:

Inaccessible view "inventory_items", "inventory_items" is not accessible in explore "order_items". Check for typos and missing joins in explore "order_items".

What caused this error to appear?

- A. A field in the order_items view references a field in the inventory_items view.
- B. A field in the inventory_items view references a field in the order_items view.
- C. There is an Explore named inventory_items which references the order_items view.
- D. There is another Explore named order_items which references the inventory_items view.

Correct Answer: A

QUESTION 2

A LookML developer has created a model with many Explores in it. Business users are having a difficult time locating the Explore they want in the long list displayed.

Which two actions can the LookML developer take to improve the user interface? (Choose two.)

- A. Apply the hidden parameter with a value of yes to Explores that only exist to power specific Looks, dashboards, or suggestion menus.
- B. Modify the business users' roles so they do not have this model in their model set.
- C. Combine the Explores into just a few Explores that each join to many views.
- D. Apply the group_label parameter to organize the Explores under different headings.
- E. Apply the fields parameter so that each Explore has fewer fields in it.

Correct Answer: BC

QUESTION 3

After running the LookML Validator, a developer sees the following error message in the Looker development environment:

“Measures with Looker aggregations (sum, average, min, max, list types) may not reference other measures”.

What could be causing this error?

- A. A measure of type: count has a sql parameter defined.
- B. A measure of type: sum adds up other measures in the sql parameter.
- C. A measure of type: sum has a SUM function written in the sql parameter.
- D. A measure of type: number has a SUM function written in the sql parameter.

Correct Answer: A

QUESTION 4

A developer needs to implement three persistent derived tables (PDTs) as described below.

The PDTs need to be refreshed after the daily ETL pipeline adds incremental loads to the underlying tables.

Each PDT is built off of one underlying table in the database (one PDT per table).

The underlying tables for each PDT are updated one after the other, and a new row is added to an ETL log table each time a table is updated.

Due to the unpredictable nature of the ETL pipeline, each PDT does not refresh at the same time from day to day.

Each PDT takes over an hour to build, and to save on compute costs each PDT should only be refreshed once per day.

How can the developer set up the PDTs according to these requirements?

- A. Create one datagroup tied to all three PDTs that runs when the total row count across all three tables changes.
- B. Create one datagroup tied to all three PDTs that parameterizes the view name for each PDT in the SQL trigger condition.
- C. Create three separate datagroups tied to three PDTs that run when each corresponding table's row count changes.
- D. Create three separate datagroups tied to three PDTs that run when a new row is added to the ETL log table.

Correct Answer: D

QUESTION 5

A developer has User Specific Time Zones enabled for a Looker instance, but wants to ensure that queries run in Looker are as performant as they can be. The developer wants to add a datatype: date parameter to all

dimension_group definitions without time data in a table-based view, so that time conversions don't occur for these fields.

How can the developer determine to which fields this parameter should be applied through SQL Runner?

- A. Open the Explore query in SQL Runner and validate whether removing the conversion from date fields changes the results.
- B. Open the Explore query in SQL Runner to determine which fields are converted.
- C. Use the CAST function in SQL Runner to ensure that all underlying fields are dates and conversions are not applied.
- D. Use the Describe feature in SQL Runner to determine which fields include time data.

Correct Answer: C
