**QUESTION 1**

A homeless lady presents with cough and fever. She complains of night sweats and weight loss. CXR has opacity.

What is the next appropriate management?

- A. IFN gamma testing
- B. Mantoux
- C. Bronchoscopy
- D. AFB
- E. CT chest

Correct Answer: D

Cough and fever and night sweat and weight loss are very suggestive of TB. She should do AF investigation.

QUESTION 2

A 37-year-old lady strongly believes that a famous politician has been sending her flowers every day and is in love with her. However, this is not the case.

What is the most likely diagnosis?

- A. Erotomania
- B. Kleptomania
- C. Pyromania
- D. Trichotillomania

Correct Answer: A

Erotomania is a type of delusion in which the affected person believes that another person, usually a stranger, high-status or famous person, is in love with them]. Kleptomania is the inability to refrain from the urge to steal items. Grandiosity refers to an unrealistic sense of superiority. Pyromania is an impulse control disorder in which individuals repeatedly fail to resist impulses to deliberately start fires, in order to relieve tension or for instant gratification. Trichotillomania is an impulse disorder characterized by the compulsive urge to pull out one's hair, leading to noticeable hair loss and balding

QUESTION 3

Old patient complaining of bone and joint pain, bleeding, recurrent infections. Labs show: lymphocytosis, myelocytes 3%, and myeloblast 2%.

What is the diagnosis?

- A. AML
- B. Thalassaemia
- C. Sickle cell anemia
- D. CML

Correct Answer: D

Most common in Old and with usually increased WBC count and massive splenomegaly and characterized by Philadelphia (Ph) chromosome in bone marrow cells. ALL is most common in children. AML has more than 20% blasts on Bone marrow. Tip: The above patient is presented with acute Blasts crisis.

QUESTION 4

A 76-year-old woman is brought in for respiratory distress and altered mental status. Her medical history records right-sided hemiplegia from a stroke several years ago. She has blood pressure 86/52; heart rate 123 BPM, breathing rate 33 Br PM, temperature 102.3?, and O2 sat 84%. Exam reveals rhonchi bilaterally with "E to Ah" changes and warm extremities with faint pulses. Chest x-ray shows bilateral infiltrates.

What is the likely etiology of this patient's hypotension?

- A. Neurogenic shock
- B. Cardiogenic shock
- C. Septic shock
- D. Hypovolemic shock

Correct Answer: C

This patient is presenting with 3 SIRS criteria: hypotension, altered mental status, and a source of infection (pneumonia). The physical exam is also consistent with septic shock: Massive vasodilation has yielded warm extremities and faint pulses. Both hypovolemic shock and cardiogenic shock would have pale and cool extremities. There is no mention of bleeding, ruling out hemorrhagic shock.

QUESTION 5

17 year's female with lump in the breast, freely mobile, not attached to the skin. What is the next investigation?

- A. Ultrasound
- B. Mammogram
- C. FNA
- D. Biopsy

Correct Answer: B
