**QUESTION 1**

A company wants to migrate its on-premises servers to AWS. These servers include SAP ERP Central Component (SAP ECC) on Oracle Database. The company is running SAP ECC application servers and Oracle Database servers on AIX. The company must migrate the SAP workloads to AWS with minimal changes.

Which solution will meet these requirements?

- A. Perform a heterogeneous migration for SAP on AWS Specify the SAP ECC application servers to run on SUSE Linux Enterprise Server Specify Oracle Database to run on Oracle Enterprise Linux on a Dedicated Host
- B. Perform a homogeneous migration for SAP on AWS Specify the SAP ECC application servers and Oracle Database to run on AIX
- C. Perform a heterogeneous migration for SAP on AWS Specify the SAP ECC application servers and Oracle Database to run on Oracle Enterprise Linux.
- D. Perform a heterogeneous migration for SAP on AWS Specify the SAP ECC application servers and Oracle Database to run on Windows.

Correct Answer: A

QUESTION 2

A company is running an SAP ERP Central Component (SAP ECC) system on an SAP HANA database that is 10 TB in size. The company is receiving notifications about long-running database backups every day. The company uses AWS Backint Agent for SAP HANA (AWS Backint agent) on an Amazon EC2 instance to back up the database. An SAP NetWeaver administrator needs to troubleshoot the problem and propose a solution.

Which solution will help resolve this problem?

- A. Ensure that AWS Backint agent is configured to send the backups to an Amazon S3 bucket over the internet. Ensure that the EC2 instance is configured to access the internet through a NAT gateway.
- B. Check the UploadChannelSize parameter for AWS Backint agent. Increase this value in the aws-backint-agent-config.yaml configuration file based on the EC2 instance type and storage configurations.
- C. Check the MaximumConcurrentFilesForRestore parameter for AWS Backint agent. Increase the parameter from 5 to 10 by using the aws-backint-agent-config.yaml configuration file.
- D. Ensure that the backups are compressed if necessary. Configure AWS Backint agent to compress the backups and send them to an Amazon S3 bucket.

Correct Answer: A

QUESTION 3

A company plans to migrate its SAP NetWeaver deployment to AWS. The deployment runs on a Microsoft SQL Server database. The company plans to change the source database from SQL Server to SAP HANA as part of this process.

Which migration tools or methods should an SAP solutions architect use to meet these requirements? (Select TWO.)

- A. SAP HANA classical migration
- B. SAP HANA system replication
- C. SAP Software Update Manager (SUM) Database Migration Option (DMO) with System Move
- D. SAP HANA backup and restore
- E. SAP homogeneous system copy

Correct Answer: CD

QUESTION 4

A company has an SAP Business One system that runs on SUSE Linux Enterprise Server 12 SP3. The company wants to migrate the system to AWS. An SAP solutions architect selects a homogeneous migration strategy that uses AWS Application Migration Service (CloudEndure Migration).

After the server migration process is finished, the SAP solutions architect launches an Amazon EC2 test instance from the R5 instance family. After a few minutes, the EC2 console reports that the test instance has failed. An instance status check shows that network connections to the instance are refused.

How can the SAP solutions architect solve this problem?

- A. Reboot the instance to initiate instance migration to another host
- B. Request an instance limit increase for the AWS Region where the test instance is being launched
- C. Create a ticket for AWS Support that documents the test server instance ID. Wait for AWS to update the host of the R5 instance.
- D. Install the missing drivers on the source system. Wait for the completion of migration synchronization. Launch the test instance again.

Correct Answer: D

QUESTION 5

A company uses an SAP application that runs batch jobs that are performance sensitive. The batch jobs can be restarted safely. The SAP application has spot application servers. The SAP application functions reliably as long as the SAP application availability remains greater than 60%. The company wants to migrate the SAP application to AWS. The company is using a cluster with two Availability Zones.

How should the company distribute the SAP application servers to maintain system reliability?

- A. Distribute the SAP application servers equally across three partition placement groups
- B. Distribute the SAP application servers equally across three Availability Zones
- C. Distribute the SAP application servers equally across two Availability Zones
- D. Create an Amazon EC2 Auto Scaling group across two Availability Zones. Set a minimum capacity value of 4.

Correct Answer: B
