**QUESTION 1**

How does Twistlock offer workload security at runtime?

- A. works with the IDP to identify over-privileged containers and services and restricts network access
- B. quarantines containers that demonstrate increased CPU and memory usage
- C. automatically patches vulnerabilities and compliance issues for every container and service
- D. builds a whitelist security model automatically for every container and service

Correct Answer: A

QUESTION 2

What is the default session distribution policy in the PA-7000 Series?

- A. Hash
- B. Egress-Slot
- C. Round Robin
- D. Ingress-Slot

Correct Answer: D

(PA-7000 Series firewalls only) New sessions are assigned to a DP on the same NPC on which the first packet of the session arrived. The selection of the DP is based on the session-load algorithm but, in this case, sessions are limited to the DPs on the ingress NPC.

Depending on the traffic and network topology, this policy generally decreases the odds that traffic will need to traverse the switch fabric.

Use this policy to reduce latency if both ingress and egress are on the same NPC. If the firewall has a mix of NPCs (PA-7000 20G and PA-7000 20GXM for example), this policy can isolate the increased capacity to the corresponding NPCs and help to isolate the impact of NPC failures.

QUESTION 3

Which three software components have integration for deploying a VM-Series firewall in OpenStack? (Choose three)

- A. Mirantis OpenStack distribution
