- ⚙️ **100% Money Back** Guarantee
- ⚙️ **365 Days** Free Update
- ⚙️ **800,000+** Satisfied Customers

**QUESTION 1**

An administrator is using Update Manager 5.x to update virtual appliances in a vSphere environment. The environment is using the vCenter Server Virtual Appliance (vCSA). What would cause the remediation to fail?

- A. Updating of the appliance can only be done if the vCenter Server Virtual Appliance (vCSA) has been put into Maintenance Mode.
- B. Remediation must be configured on the Appliance Administration page before use.
- C. Remediation of the vCenter Server Virtual Appliance (vCSA) with Update Manager is not supported.
- D. Remediation requires the hosts to be connected to vCenter using an IPv4 address.

Correct Answer: D

Update Manager 5.0 does not support virtual machine patch baselines. If a host is connected to vCenter Server by using an IPv6 address, you cannot scan and remediate virtual machines and virtual appliances that run on the host.

QUESTION 2

An administrator using vCenter Operations Manager notices an increase in resource consumption by virtual machines over a period of time. The administrator needs to understand how adding more hosts or increasing resources in existing hosts will address the growing resource requirements of the virtual machines. Which vCenter Operations Manager feature can provide this information?

- A. Host or Cluster Capacity Optimization Report
- B. What-if Scenarios
- C. Density and Reclaimable Waste badges
- D. Virtual Machine Optimization Report

Correct Answer: B

QUESTION 3

A system administrator has an application installed on a physical machine that is licensed to the MAC address of the physical NIC. This system needs to be virtualized.

What two methods could an administrator use to ensure the license will function in the virtual machine? (Choose two.)

- A. Manually set the MAC address for the vNIC in the guest OS
- B. Install the NIC from the physical server into the ESXi host
- C. Manually set the MAC address for the vNIC using the Web Client
- D. Configure the physical server's MAC address in the virtual switch

Correct Answer: AC

QUESTION 4

Which three files are valid virtual machine files that might be identified when examining a folder that contains a virtual machine template on a VMFS datastore? (Choose three.)

- A. RDM map file (-rdm.vmdk)
- B. BIOS settings file (.bios)
- C. Template file (.vmtx)
- D. Lock file (.lck)
- E. Suspended state file (.vmsn)

Correct Answer: ACE

RDM map file, template file and suspended state file are virtual machine files that reside in a folder named after that virtual machine. The template file is related to virtual machines configurations and the suspended state file is related to configuration that suspends virtual machines. RDM is a mapping file in a separate VMFS volume that acts as a proxy for a raw physical storage device. The RDM allows a virtual machine to directly access and use the storage device. The RDM contains metadata for managing and redirecting disk access to the physical device. The file gives you some of the advantages of direct access to a physical device while keeping some advantages of a virtual disk in VMFS. As a result, it merges VMFS manageability with raw device access. RDMs can be described in terms such as mapping a raw device into a datastore, mapping a system LUN, or mapping a disk file to a physical disk volume. All these terms refer to RDMs.

QUESTION 5

Which two network settings are available on a vSphere Standard Switch? (Choose two.)

- A. Ingress traffic shaping
- B. Egress traffic shaping
- C. Private Virtual Local Area Networks (PVLAN)
- D. Virtual Local Area Networks (VLAN)

Correct Answer: BD
