**QUESTION 1**

Scenario: An administrator needs to upgrade the current XenServer environment to version 6.0. The current XenServer environment consists of 20 production virtual machines running mission- critical applications.

When is it appropriate for the administrator to use the rolling pool upgrade wizard in this environment?

- A. When upgrading from XenServer 5.5 or earlier
- B. When high availability is enabled in the current environment
- C. When virtual machines in the current environment need to keep running
- D. When the current environment contains a SAN adapter for the StorageLink storage repository

Correct Answer: C

QUESTION 2

Scenario: An administrator of a XenServer pool needs to ensure that virtual machines will be available in the event of a disaster. A backup XenServer implementation is in place in another location; however, there is NO replication available.

In preparation for disaster recovery, which step should the administrator perform?

- A. Run the vm-export command.
- B. Run the vm-migrate command.
- C. Take a snapshot of the virtual machines.
- D. Install backup agents on the virtual machines.

Correct Answer: A

QUESTION 3

An administrator needs to resolve intermittent host issues related to high availability. Which two actions can the administrator take to resolve this issue? (Choose two.)

- A. Change storage repositories.
- B. Implement Disaster Recovery.
- C. Implement workload balancing.
- D. Change management networks.

Correct Answer: AD

**QUESTION 4**

Scenario: An administrator needs to change the pool master to prepare for maintenance activities during the evening. High availability is currently enabled.

Using the XenCenter Console, what must the administrator do to change the pool master?

- A. Disable high availability.
- B. Configure workload balancing.
- C. Enable virtual machine protection policy.
- D. Enter maintenance mode on the pool master.

Correct Answer: D

QUESTION 5

An administrator needs to upgrade the existing XenServer pool consisting of four hosts to version 6.0. When can the administrator use the rolling pool upgrade wizard?

- A. When upgrading from XenServer 5.6 or later
- B. When XenServer workload balancing is enabled
- C. When the XenServer installation media is unavailable
- D. When there are at least three XenServer hosts in the pool

Correct Answer: A

QUESTION 6

An administrator needs to reconfigure the stream server boot list following a server failure.

How could the administrator ensure the replacement server is included in the stream server boot list?

- A. Restart the Stream Service.
- B. Enable Automatic vDisk updates.
- C. Update the target device "Boot From" setting.
- D. Add the IP address of the new server to the ARDBP32.bin file.

Correct Answer: D

QUESTION 7

Scenario: An administrator CANNOT use the PXE boot method with the Provisioning services environment because of

network limitations. The target devices are running on a XenServer host.

How can the administrator configure the target devices to start up using Provisioning services?

- A. Configure the BIOS bootstrap on the server.
- B. Edit the bootstrap file on the provisioning server.
- C. Set the target device to start up from the hard disk.
- D. Create a bootstrap disk with Boot Device Manager.

Correct Answer: D

QUESTION 8

An administrator configured a Provisioning services environment that consists of three provisioning servers for use with the DHCP/PXE boot process.

To configure the stream server boot list, the administrator needs to add the IP address in order to include the three provisioning servers. (Choose the correct option to complete the sentence.)

- A. of each server to the ARDBP32.BIN file
- B. and the name of each server in the lmhosts file
- C. of each server in the TFTP options of the DHCP server
- D. and the name of each server in the hosts file on all of the provisioning servers

Correct Answer: A

QUESTION 9

Scenario: An administrator has three servers in a pool each containing three physical network interface cards (NICs). Currently NIC 0 is used for management, NIC 1 for virtual machine traffic, and NIC 2 for storage traffic.

Which network type must the administrator create to access multiple VLANs for virtual machine traffic?

- A. Bonded
- B. External
- C. Cross-server private
- D. Single-server private

Correct Answer: B

QUESTION 10

Scenario: An administrator is creating a vDisk image of a physical Windows server using XenConvert. This vDisk is going to be used by multiple target devices in Standard Image mode.

What does the administrator need to do during the physical-to-virtual conversion to increase the vDisk performance?

- A. SysPrep the vDisk.
- B. Optimize the vDisk.
- C. Run the Windows server in Safe mode.
- D. Defragment the physical hard disk before conversion.

Correct Answer: B

QUESTION 11

Scenario: An administrator is troubleshooting a Provisioning services farm that consists of two identical servers and 100 identical target devices. From the Provisioning Services Console the administrator notices that one of the provisioning servers has twice the amount of target devices connected compared with the other provisioning server. The vDisk used and the provisioning servers are configured to use high availability and load balancing.

What should the administrator check to correct load balancing?

- A. Power Rating
- B. Bootstrap options
- C. vDisk access mode
- D. Offline database support

Correct Answer: A

QUESTION 12

Scenario: A new email virus threat has been publicly announced, but virus definitions are NOT yet available for protection. An administrator manages the virtual machine hosting the mail server of the company. There are NO redundant mail servers available and mail flow CANNOT be interrupted.

What can the administrator do as a preventive tactic?

- A. Preserve the virtual machine by exporting it to an external drive.
- B. Enable high availability to ensure the virtual machine remains online.
- C. Make a copy of the virtual machine in case the original gets infected.
- D. Perform an online backup by taking a snapshot of the virtual machine.

Correct Answer: D

**QUESTION 13**

An administrator needs to configure a Provisioning services environment for Microsoft volume license management.

Which properties could the administrator configure to accomplish this task?

- A. Farm
- B. vDisk
- C. Server
- D. Target device

Correct Answer: B

QUESTION 14

Scenario: An administrator has added a new provisioning server to an existing farm. The store is on a separate file server.

What does the administrator need to configure to have existing virtual machines use the Stream Service from the new provisioning server?

- A. vDisk store
- B. TFTP Service
- C. DHCP options
- D. Bootstrap options

Correct Answer: D

QUESTION 15

Scenario: A virtual machine that uses Provisioning services is accidentally deleted by an administrator. The administrator creates a new virtual machine from the same template that was used to create the virtual machine deleted. However, the virtual machine is NOT able to start up from the vDisk.

What must the administrator do to resolve the issue?

- A. Assign the correct vDisk to the target device.
- B. Reconfigure the target device MAC address.
- C. Configure the target device to start up from vDisk.
- D. Create a target device for the new virtual machine.

Correct Answer: B
